

SMITHSONIAN CONTRIBUTIONS TO BOTANY • NUMBER 107

Grasses of Chihuahua, Mexico

Yolanda Herrera Arrieta and Paul M. Peterson

SERIES PUBLICATIONS OF THE SMITHSONIAN INSTITUTION

Emphasis upon publication as a means of "diffusing knowledge" was expressed by the first Secretary of the Smithsonian. In his formal plan for the Institution, Joseph Henry outlined a program that included the following statement: "It is proposed to publish a series of reports, giving an account of the new discoveries in science, and of the changes made from year to year in all branches of knowledge." This theme of basic research has been adhered to through the years in thousands of titles issued in series publications under the Smithsonian imprint, commencing with Smithsonian Contributions to Knowledge in 1848 and continuing with the following active series:

Smithsonian Contributions to Anthropology
Smithsonian Contributions to Botany
Smithsonian Contributions to History and Technology
Smithsonian Contributions to the Marine Sciences
Smithsonian Contributions to Museum Conservation
Smithsonian Contributions to Paleobiology
Smithsonian Contributions to Zoology

In these series, the Smithsonian Institution Scholarly Press (SISP) publishes small papers and full-scale monographs that report on research and collections of the Institution's museums and research centers. The Smithsonian Contributions Series are distributed via exchange mailing lists to libraries, universities, and similar institutions throughout the world.

Manuscripts intended for publication in the Contributions Series undergo substantive peer review and evaluation by SISP's Editorial Board, as well as evaluation by SISP for compliance with manuscript preparation guidelines (available at https://scholarlypress.si.edu). For fully searchable PDFs of all open access series and publications of the Smithsonian Institution Scholarly Press, visit Open SI at http://opensi.si.edu.

Grasses of Chihuahua, Mexico

Yolanda Herrera Arrieta and Paul M. Peterson

ABSTRACT

Herrera Arrieta, Yolanda, and Paul M. Peterson. Grasses of Chihuahua, Mexico. *Smithsonian Contributions to Botany*, number 107, x + 380 pages, 246 figures, 1 table, 2018.—Our revision of the grasses of Chihuahua includes 385 species in 95 genera, 15 subspecies, 29 varieties, and 4 forms. We provide keys for determination, detailed descriptions, nomenclatural synonyms, ecological information on habitat, distribution based on herbarium specimens, and illustrations for 251 species and 8 varieties. We provide a new combination for *Cenchrus polystachios* subsp. *setosus*.

RESUMEN

Herrera Arrieta, Yolanda, and Paul M. Peterson. Grasses of Chihuahua, México. *Smithsonian Contributions to Botany*, número 107, x + 380 páginas, 246 figuras, 1 tabla, 2018.—Nuestra revisión de las gramíneas de Chihuahua incluye 385 especies en 95 géneros, 15 subespecies, 29 variedades y 4 formas. Se proveen claves para su determinación, descripciones detalladas, sinónimos nomenclaturales, información ecológica del hábitat, distribución con base en ejemplares de herbario e ilustraciones de 251 especies y 8 variedades. Proporcionamos una nueva combinación para *Cenchrus polystachios* subsp. *setosus*.

This research was funded, in part, by the Consejo Nacional de Ciencia y Tecnología del Estado de Durango and the Instituto Politécnico Nacional.

Cover images, from left to right: *Sporobolus spiciformis* spikelet (Figure 235C); *Muhlenbergia tarahumara* habit (Figure 178A); *M. longiligula* floret (Figure 162H); *Poa matri-occidentalis* subsp. *mohinorensis* ligule (Figure 207D); *M. rigida* inflorescence (Figure 170C); *Festuca tolucensis* stylized growth form (Figure 124B); *M. pereilema* portion of inflorescence (Figure 167G).

Grasses of Chihuahua, Mexico

Yolanda Herrera Arrieta¹ and Paul M. Peterson²*

Mexico

INTRODUCTION

Chihuahua is the largest state in Mexico, occupying 12.6% of the total area, and is bounded by the meridians 31.78333° and 25.63333° north and 103.30000° and 109.11667° west. Chihuahua is divided into 67 municipios [municipalities] (Figure 1, Table 1). The state includes portions of three natural ecoregions: the Sierra Madre Occidental (SMO) pine-oak woodlands, which contain extensive grasslands; the Chihuahuan Desert grassland, which is considered a center of origin and diversification for plant and animal species; and a smaller area west of the SMO called the Sonoron-Sinaloan transition subtropical dry forests (LeSueur, 1945; Olson et al., 2001). The SMO and Chihuahuan Desert regions include species that have both northern and southern affinities whereas the Sonoron-Sinaloan transition subtropical forests are represented by species with primarily southern neotropical affinities (Axelrod, 1979; Rzedowski, 1993).

Twenty-one herbaria were visited and specimens were verified before inclusion in the Specimens Examined sections. Specimen data provided in these sections are reproduced from specimen labels. The herbaria abbreviations are as follows:

For the grasses of Cascada de Basaseachi and adjacent areas, Spellenberg et al. (1996) lists 85 grass species of which 25 now occur in *Muhlenbergia* Schreb. Lebgue and Valerio (1986) included 291 grass species for Chihuahua of which 51 now occur in *Muhlenbergia*. Valdés Reyna (1977) included 314 grass species in 87 genera for Chihuahua of which 59 species now occur in *Muhlenbergia*. Our current treatment includes 385 grass species for Chihuahua of which 78 occur in *Muhlenbergia*. *Muhlenbergia* is the most diverse grass genus in Mexico, and its center of diversity lies within the state of Chihuahua. This is perhaps a reflection of the number of different habitats that are found in the state and the adaptive ability of the *Muhlenbergia* to colonize these habitats.

The following 68 grasses (17.7% of total) are introduced in Chihuahua (marked with an asterisk [*] within the description): Agropyron cristatum, Agrostis stolonifera var. palustris, Alopecurus geniculatus, Anthoxanthum odoratum, Arundo donax, Avena fatua, A. sativa, Bromus catharticus, B. japonicus, B. tectorum, Cenchrus americanus, C. ciliaris, C. clandestinus, C. echinatus, C. polystachios, Chloris gayana, Cortaderia selloana, Cynodon dactylon, Dactylis glomerata, Dactyloctenium aegyptium, Dichanthium annulatum, Digitaria sanguinalis, Echinochloa colona, E. crus-galli, Eleusine indica, E. multiflora, Elymus repens, Eragrostis barrelieri, E. cilianensis, E. ciliaris, E. curvula, E. echinochloidea, E. lehmanniana, E. pilosa, E. superba, Eriochloa contracta, Festuca myuros, Hackelochloa granularis, Heteropogon contortus, H. melanocarpus, Holcus lanatus, Hordeum murinum, H. vulgare, Lolium arundinaceum, L. multiflorum, L. perenne, Melinis repens, Panicum antidotale, P. dichotomiflorum, Phalaris aquatica, P. canariensis, P. paradoxa, Poa annua, Polypogon monspeliensis, P. viridis, Schismus arabicus, S. barbatus, Setaria adhaerens, S. pumila, S. verticillata, S. viridis, Sorghum bicolor, S. halepense, Stenotaphrum secundatum, Thinopyrum intermedium, Tragus berteronianus, Triticum aestivum, and Urochloa plantaginea.

The following 17 species are cultivated as food for humans (+) or livestock (++) or as ornamentals (+++): Avena sativa (+, ++), Bouteloua curtipendula (++), B. gracilis (++), Cenchrus ciliaris (++), C. clandestinus (+++), Cortaderia selloana (+++), Disakisperma dubium (++), Eragrostis curvula (++), E. superba (++), Hordeum vulgare (+, ++), Lolium multiflorum (++), L. perenne (++), Panicum virgatum (++), Phalaris canariensis (++), Sorghum bicolor (++), Triticum aestivum (+), and Zea mays subsp. mays (+, ++) (Esqueda Coronado et al., 2005; Saenz Flores et al., 2015).

There are six endemic grass species and one subspecies known only from Chihuahua: Bouteloua chihuahuana, Festuca dichlina, Muhlenbergia argentea, M. decumbens, M. majalcensis, Poa matri-occidentalis subsp. mohinorensis, and Triniochloa laxa.

With the infusion of molecular data, the present concept and classification of the grasses is changing at a rapid rate. We follow the grass classification presented in Soreng et al. (2017a, 2017b) and Peterson et al. (2014a, 2016, 2017), which consists

of ±11,506 species in 768 genera found in 12 subfamilies, 52 tribes, and 94 subtribes. Below we provide a synopsis of the classification for all grass genera that occur in Chihuahua.

Synopsis

The following list is a synopsis of the classification of the genera into subfamily, tribe, and subtribe for the grasses of Chihuahua, Mexico.

subfamily Aristidoideae tribe Aristideae: *Aristida* subfamily Arundinoideae tribe Arundineae: *Arundo* tribe Molinieae: *Phragmites* subfamily Bambusoideae tribe Bambuseae

subtribe Guaduinae: Otatea

subfamily Chloridoideae tribe Cynodonteae

subtribe Boutelouinae: Bouteloua

 $subtribe\ Dactylocteninae:\ Dactyloctenium$

subtribe Eleusininae: Chloris, Cynodon, Dinebra,
Diplachne, Disakisperma, Eleusine,
Leptochloa

subtribe Gouiniinae: *Tridentopsis* subtribe Hilariinae: *Hilaria* subtribe Kaliniinae: *Kalinia*

subtribe Monanthochloinae: *Distichlis* subtribe Muhlenbergia

subtribe Pappophorinae: Pappophorum, Tridens

subtribe Scleropogoninae: *Dasyochloa*. *Blepharidachne*, *Erioneuron*, *Munroa*,

Scleropogon

subtribe Traginae: Tragus

tribe Eragrostidieae

subtribe Cotteinae: Cottea, Enneapogon subtribe Eragrostidinae: Eragrostis

tribe Zoysieae

subtribe Sporobolinae: Sporobolus

subfamily Danthonioideae

tribe Danthonieae: Cortaderia, Schismus

subfamily Oryzoideae

tribe Oryzeae

subtribe Oryzinae: *Leersia* subtribe Zizaniinae: *Luziola*

subfamily Panicoideae

tribe Andropogoneae

subtribe Andropogoninae: Andropogon,
Bothriochloa, Dichanthium,
Heteropogon, Schizachyrium
subtribe Rottboelliinae: Hackelochloa
subtribe Saccharinae: Imperata, Sorghastrum,
Sorghum, Trachypogon

subtribe Tripsacinae: Elionurus, Tripsacum, Zea tribe Paniceae

subtribe Anthephorinae: Digitaria

subtribe Boivinellinae: Echinochloa, Lasiacis,

Oplismenus

subtribe Cenchrinae: Cenchrus, Setaria, Setariopsis, Stenotaphrum, Zuloagaea

subtribe Melinidinae: Chaetium, Eriochloa, Melinis, Urochloa

subtribe Panicinae: Panicum

tribe Paspaleae

subtribe Paspalinae: Hopia, Paspalum

subfamily Poiodeae

tribe Bromeae: Bromus

tribe Meliceae: Glyceria, Melica, Triniochloa

tribe Poeae

subtribe Agrostidinae: Agrostis, Calamagrostis,

Polypogon

subtribe Airinae: Avenella

subtribe Alopecurinae: Alopecurus

subtribe Anthoxanthinae: Anthoxanthum

subtribe Aristaveninae: Deschampsia

subtribe Aveninae: Avena, Koeleria, Peyritschia,

Sphenopholis, Trisetum subtribe Dactylidinae: Dactylis

subtribe Holcinae: Holcus

subtribe Holcinae: Holcus

subtribe Loliinae: Festuca, Lolium

subtribe Phalaridinae: Phalaris

subtribe Poinae: Poa

tribe Stipeae: Achnatherum, Hesperostipa, Nassella,

Piptochaetium

tribe Triticeae: Aegilops, Agropyron, Elymus, Hordeum, Thinopyrum, Triticum

ACKNOWLEDGMENTS

We thank the Instituto Politécnico Nacional (SIP-20091209, SIP-20100879), Consejo Nacional de Ciencia y Tecnología del Estado de Durango, and La Comisión Nacional para el Conocimiento y Uso de la Biodiversidad (GE003) for financial support. The U.S. National Herbarium, Department of Botany, National Museum of Natural History, Smithsonian Institution, is thanked for providing YHA work space in the U.S. National Herbarium. We thank the National Geographic Society Committee for Research and Exploration (Grant No. 8848-10, 8087-06) for field and laboratory support. For financial support we thank the Smithsonian Institution's Restricted Endowments Fund, the Scholarly Studies Program, Research Opportunities, Atherton Seidell Foundation, Biodiversity Surveys and Inventories Program, Small Grants Program, the Laboratory of Analytical Biology, and the U.S. Department of Agriculture. We also thank Konstantin Romaschenko and Jeffery M. Saarela for accompanying PMP on numerous field expeditions; Robert J. Soreng for many extended discussions pertinent to the manuscript, especially regarding nomenclature; Utah State University for permission to pay for use of 223 illustrations that appeared in the *Flora of North America*, Volumes 24 and 25; Socorro Gonzalez Elizondo for help generating our list of cultivated grasses; and Patricia Dávila, Emmet J. Judziewicz, Teresa Mejia Saulés, and Ana Soriano for critical review and suggestions for improvement to the manuscript.

FAMILY DESCRIPTION: POACEAE

Annual or perennial; usually terrestrial, sometimes aquatic; tufted, mat-forming, caespitose, pluricaespitose, or with solitary culms (flowering stems); rhizomes and stolons often welldeveloped. Culms annual or perennial, herbaceous or woody, usually erect or ascending, sometimes prostrate or decumbent for much of their length, occasionally climbing, rarely floating; nodes prominent, sometimes concealed by the sheaths; internodes hollow or solid, bases meristematic; branching from the basal nodes only or from the basal, middle, and upper nodes; basal branching extravaginal or intravaginal; branching from the upper nodes intravaginal, extravaginal, or infravaginal. Leaves alternate, 2-ranked, each composed of a sheath and blade encircling the culm or branch; sheaths usually open, sometimes closed, the margins fused for all or part of their length; auricles (lobes of tissue extending beyond the margins of the sheaths on either side) sometimes present; ligules usually present at the sheath-blade junction, particularly on the adaxial surface, abaxial ligules common in the Bambusoideae, membranous, sometimes ciliate, adaxial ligules usually present, of membranous to hyaline tissue, a line of hairs, or a ciliate membrane; blades usually linear to lanceolate, occasionally ovate to triangular, bases sometimes pseudopetiolate (having a petiole-like constriction), venation usually parallel, sometimes with evident cross veins, occasionally divergent. Inflorescences (synflorescences) usually compound, composed of simple or complex aggregations of primary inflorescences, aggregations paniculate, spicate, or racemose or of spikelike branches, often with an evident rachis (central axis), primary inflorescences spikelets, pseudospikelets, or spikelet equivalents; inflorescence branches usually without obvious bracts. Spikelets with (0-1)2(3-6) glumes (empty bracts) subtending 1-60 florets, glumes and florets distichously attached to a rachilla (central axis); pseudospikelets with bud-subtending bracts below the glumes. Glumes usually with an odd number of veins, sometimes awned. Florets bisexual, staminate, or pistillate, usually composed of a lemma (lower bract) and palea (upper bract), lodicules, and reproductive organs, often laterally or dorsally compressed, sometimes round in cross section; lemmas usually with an odd number of veins, often awned, bases frequently thick and hard, forming a callus, backs rounded or keeled over the midvein, awns usually 1(3), arising basally to terminally; paleas usually with 2 major veins, with 0 to many additional veins between the major veins, sometimes also in the margins, often keeled over the major veins; lodicules (0)2-3, inconspicuous, usually without veins, bases swelling at anthesis; stamens usually 3, sometimes 1(2) or 6+, filaments capillary, anthers versatile, usually all alike within a floret, sometimes 1 or 2 evidently longer than the others; ovaries 1-loculed, with (1)2-3(4) styles or style branches, stigmatic region usually plumose. Fruits caryopsis, pericarp usually dry and adhering to the seed, sometimes fleshy or dry and separating from the seed at maturity or when moistened; embryos 1/5 as long as to almost equaling the caryopsis, highly differentiated with a scutellum (absorptive organ), a shoot with leaf primordium covered by the coleoptile (shoot sheath), and a root covered by the coleorhiza (root sheath); hila punctate to linear. Base chromosome number, x = 5, 6, 7, 9, 10, 11, 12.

KEY TO THE GRASS GENERA OF CHIHUAHUA

1. Plante consults limiford, culma height 2 m on mons
1. Plants generally lignified; culms height 2 m or more.
2. Culms solid or hard-walled and thick; nodes producing generally 3 branches; foliage leaves pseudopetiolateOtatea
2. Culms hollow, thin-walled; nodes producing generally 2 branches; leaf blades narrow-linear, never pseudopetiolate.
3. Inflorescence an ovoid panicle, diffuse, 10–30 cm long; spikelets 3–4.7 mm long, globose, with 2 florets, 1 fertile and
1 sterile Lasiacis
3. Inflorescence a plumose panicle, dense, 40-60 cm long; spikelets 10-15 mm long, compressed, with (2)3-9 fertile
florets.
4. Lemma pilose with spreading hairs that are long and silky; rachilla hairless; blades strongly cordate-auriculate
basally Arundo
4. Lemma glabrous; rachilla pilose with long, silky hairs; blades narrow basally
1. Plants generally herbaceous; culms height less than 2 m, occasionally up to 4 m tall (in <i>Tripsacum</i>).
5. Spikelets unisexual, staminate appreciably different from pistillate.
6. Plants monoecious, staminate and pistillate spikelets in the same plant.
7. Staminate and pistillate spikelets in the same inflorescence

7. Staminate and pistillate spikelets in separate inflorescences.

6. Plants dioecious, staminate and pistillate spikelets in separate plants.
9. Key to pistillate plants.
10. Lemmas and reduced florets of pistillate spikelets awnless.
11. Pistillate spikelets surrounded by a "false involucre," formed by hardened glumes united at base; inflores-
cences not terminal and partially hidden by the sheath
11. Pistillate spikelets without a "false involucre"; inflorescences terminal
10. Lemmas and reduced florets of pistillate spikelets conspicuously awned
9. Key to staminate plants. 12. Inflorescence a pectinate spike, with spikelets inserted at the side of the rachis; glumes obtuse to short
acuminate
12. Inflorescence not pectinate; glumes long acuminate to an acute or awned apex.
13. Glumes and lemma strongly carinate, acute, the glumes ² / ₃ as long as basal lemma; leaves clearly dis-
tichously arranged
13. Glumes and lemma not carinate, long acuminate, glumes almost as long as the basal lemmas, leaves not
distichously arranged
5. Spikelets usually perfect, or if unisexual, then staminate spikelets not very different from the pistillate.
14. Spikelets involucrate, in groups of 2–3(5); sometimes (in <i>Hordeum</i>) lateral spikelets reduced to awns.
15. Spikelets with thorns, or with an involucre of bristles or spines; awns absent.
16. Upper glume of the lower spikelets equipped with hooked spines over the veins; involucre absent
Tragus
16. Upper glume without spines; involucre present of spines or bristles
17. Spikelets surrounded by "false involucres" composed of glumes united at base, the false involucre 4- to
6-lobed.
18. Inflorescence with short-pedicelled spikes, partially included in the upper sheaths, or false involucres whit-
ish, lacking glands; florets pistillate
18. Inflorescence a terminal, notably exserted spiciform raceme, often with blackish glands; florets perfect
Hilaria
17. Spikelets without a "false involucre" composed of hardened glumes, united at base.
19. Spikelets in capitate involucres, subsessile spikelets in "hardly leaved portions" of short plants (culms
3–10 cm), hidden by wide sheaths
 Spikelets not in capitate involucres, inflorescences of another form, or if in involucres, then well- exserted.
20. Spikelets densely crowded in symmetrical spikes, disposed at both sides of the rachis; lemmas usually
with awns 1–3 cm long.
21. Spikelets 3 per node, with 1 floret, the lateral ones pedicelled, usually reduced to awns; plants
strictly annual
21. Spikelets 1 to 3 per node, with 2 similar florets; plants perennial.
22. Glumes and lemmas stiff and thick, indurate to coriaceous; lemmas mostly awnless or if
awned, then the awns to 5 mm
22. Glumes not so stiff and thick, lemmas awned, awns 10-40 mm (2-4[10] mm long in
E. repens) Elymus
20. Spikelets crowded frequently on unilateral spikes or racemes, occasionally disposed on both sides
of the rachis (but then the inflorescence loose); lemmas with awns less than 1 cm long, sometimes
awnless. 23. Inflorescence dimorphic; lateral spikelets staminate, 2-flowered, central spikelet 3-flowered; first
floret perfect, short stipitate, the lateral florets staminate or sterile
23. Inflorescences monomorphic, spikelets all 1-flowered or 2- to 3(4)-flowered, the florets
dimorphic.
24. Spikelets 1-flowered, the central perfect, the laterals staminate or neutral; glumes oblong to
oblong-obovate with a short terminal awn
24. Spikelets 2- to 3(4)-flowered, with 1 perfect floret and 1 to several staminate or sterile
florets, long-awned or reduced to awns; glumes variably shaped, short-awned, mucronate, or
awnless

- 14. Spikelets not involucrate. 25. Spikelets with 1 perfect floret, or if dioecious, plants then with 1 staminate or pistillate functional floret, additional reduced florets present or absent. 26. Spikelets arranged in pairs, 1 sessile and another pedicelled, the pedicelled spikelet staminate, neutral or reduced, sometimes represented by only the pedicel; lower glume large and firm, enclosing the second within its margins; lemma of perfect florets membranous, slender, often awned. 27. Spikelets all alike and perfect. 28. Spikelets unawned; panicle densely silky, with long hairs surrounding the base of the spikelets. 28. Spikelets awned. 29. Rachis readily breaking up into joints; pedicel often tipped by a rudimentary spikelet; panicle often 29. Rachis continuous; pedicel never with a rudimentary floret; panicle yellow to golden brown, usually 27. Spikelets not all alike and perfect, the pedicellate ones (sometimes some of the sessile ones) staminate or neuter. 30. Spikelets all awnless. 31. Spikelets sessile, globose; lower glume ornamented, black, rough; plants annual; inflorescences 31. Spikelets sessile, not globose; lower glume never ornamented, stramineous, smooth; plants perennial; 30. Spikelets awned, at least some of them. 32. Awns at least (2.5)3 cm long. 33. Pedicelled spikelets awned, perfect; sessile (to subsessile) spikelets staminate or neutral, awnless 33. Pedicelled spikelets awnless, staminate or neutral; sessile spikelets perfect, awned. 32. Awns at most 2.5 cm long, or missing. 35. Branches of the panicle numerous, freely branched, not conspicuously spiciform. 36. Pedicelled spikelets reduced, represented by a pedicel; sessile spikelet usually hispidulous 36. Pedicelled spikelets nearly the same size as sessile ones, staminate or sometimes neutral; 35. Branches of the panicle 1 to several, not branched or sparsely so, apparently spiciform.
 - 37. Inflorescence a spike, slender, partially enclosed by a sheath in the way of spathe; pedicels and
 - 37. Inflorescence a spreading panicle, with 2 to several racemose spikes; pedicels and rachis internodes not clavate or spongy.
 - 38. Rachis internodes and pedicels with a central narrow groove, hyaline and translucent;
 - 38. Rachis internodes and pedicel without a central translucent groove; racemes 2 or 3, digitate, spatheate Andropogon
 - 26. Spikelets arranged in pairs or not, if in pairs, then pedicelled spikelets not reduced, and the lower glumes not longer and firmer than the lemma of the perfect florets.
 - 39. Spikelets laterally compressed.

 - 40. Inflorescence a dense or open panicle.
 - 41. Leaves pubescent; florets 2, the lower perfect, awnless, the upper floret staminate with a short,
 - 39. Spikelets dorsally compressed.
 - - 42. Reduced floret present, placed below the fertile floret, represented by a lemma similar to the upper glume in size and texture (with or without palea), spikelet frequently appearing to have 3 glumes; disarticulating below the glumes (spikelets falling entire at maturity).

43. Spikelets subtended by 1 to many bristles or flattened spines; bristles or spines forming an involucre, fused or not fused.
44. Bristles united at base or a little (1/5) above the base, forming a cup-shaped receptacle, subspherical, falling with the spikelets at maturity, thorny and hard or softly feathery
44. Bristles totally free, persistent, usually up to 3 mm long, not falling with the spikelets at maturity, never feathery.
45. Sterile lemma narrower than upper glume, ovate to orbiculate, with undulate or contoured base and narrow apex, a bristle present below each spikelet, but this is sometimes missing
45. Sterile lemma similar to upper glume, ovate; 1 or several bristles below each spikelet, or partially missing in the panicle
43. Spikelets not subtended by bristles or flattened spines; bristles or flattened spines not present. 46. Inflorescence with spikelets appressed to and partially embedded in the flattened, corky rachises;
upper glume present
48. Lower glume awnless.
49. Upper glume sometimes mucronate; pedicels, upper glume, and lemma with silky hairs, pink changing to white at maturity; weeds introduced in arid places Melinis49. Upper glume short-awned; pedicels, upper glumes and lemma scabrous and without
silky hairs; native aquatic plants Echinochloa
48. Lower glumes awned.
50. Awns of both glumes similar sized
50. Awn of lower glume 3 times longer than the body of the spikelet, awn of the upper
glume shorter
51. Lemma of perfect floret slender and flexible, its margins extended, membranous, not
inrolled over the palea, even when partially covering it; lower glume small or absent.
52. Inflorescences with 2 or several spiciform, spikelike branches Digitaria
52. Inflorescences with 12 of several spiciforni, spikelike branches, paniculate.
53. Panicle spreading, dense; pedicels and spikelets with silky hairs, dense, pinkish, 5–6 mm long
53. Panicle very diffuse; pedicels glabrous; upper glume and lemma sterile with sparsely silky hairs, appressed, 1–2 mm long Digitaria (D. cognata)
51. Lemma of perfect floret relatively hardened, its margins rolled on the palea; lower glume
present or absent.
54. Lower glume missing in some or all spikelets.
 55. Fertile lemma often with a terminal mucro; spikelets with a thickened callus in a ring or cup shape at the base, dorsally compressed; back of the sterile lemma oriented toward the rachis of the inflorescence
glume and fertile lemma oriented toward the rachis of the inflorecence Paspalum
54. Lower glume present in all spikelets.
56. Dorsal side of the fertile lemma facing away from the rachis; spikelets solitary; fertile lemma whitish, finely wrinkled or reticulate at maturity
56. Dorsal side of the fertile lemma (in most of the spikelets) turned toward the rachis; spikelets in pairs or solitary; fertile lemma smooth, not rough or reticulate (except in <i>Zuloagaea bulbosa</i>).
57. Primary branches of the inflorescence simple, unbranched; fertile lemma smooth, shiny
57. Primary branches of the inflorescence (at least some of them) branched; fertile lemma smooth to slightly roughened.

58. Fertile lemma and palea with a tuft of hairs at the apex; woody stems bamboo-like, often climbing Lasiacis 58. Fertile lemma and palea without a tuft of hairs at the apex; stems herbaceous, erect. 59. Terminal inflorescences with chasmogamous spikelets flowering first, axillary inflorescences with clesitogamous spikelets, smaller, laterflowering; plants with leaf dimorphism, frequently producing wide and short basal leaves in a rosette Dichanthelium 59. All inflorescences with chasmogamous spikelets, flowering at the same time; plants without leaf dimorphism, not producing wide and short basal leaves in a rosette. 60. Panicle branches 1-sided; spikelets usually subsessile; pedicels up 60. Panicle branches generally symmetrical; spikelets not subsessile; pedicels 2-20 mm long. 61. Perfect floret striate to transversely ruggose; culms with cormiform rhizomes; inflorescence branches opposite and alternate, never whorled; sheaths keeled Zuloagaea 61. Perfect floret smooth to striate, rarely slightly ruggose; culms never cormose; sheaths not keeled Panicum 42. Reduced floret absent, if present then the lemma dissimilar to the upper glume in size and texture; generally disarticulating above glumes (leaving empty glumes in mature inflorescences). 62. Spikelets with 1 or more reduced florets. 63. Inflorescence a spreading panicle; spikelets paired, golden, awned, slightly geniculate, 10–15(17) mm long; every spikelet accompanied by 1 or 2 sterile pedicels at the base Sorghastrum 63. Inflorescence with spikelets grouped in spikes, spiciform panicles or panicles with spiciform branches; spikelets green to brown (the mature ones of Hordeum become golden), awns straight, of several sizes, without sterile pedicels at the base. 64. Inflorescence a spike or spiciform panicle, cylindrical to ovoid, with the spikelets arranged symmetrically around the rachis. 65. Lemma veins of the 2 lower florets conspicuous, consistently 9 in number, prolonged into 65. Lemma veins inconspicuous; awns (if present) not plumose. 66. Lemma of perfect (actually pistillate) florets with 3 awns; plant with stolons; plants perennial Scleropogon 66. Lemma of perfect florets with 1 awn or awnless; plants not stoloniferous; plants often 67. Spikelets prominently awned, arranged in groups of 3, the lateral spikelets reduced to awns Hordeum 67. Spikelets awnless or short-awned, 3-flowered, the 2 reduced florets never awnlike 68. Reduced florets sterile, shorter than perfect florets, reduced to small scale-like 68. Reduced florets staminate or sterile, longer than the perfect florets, brownish, hirsute, awned, 1 of the awns twisted and exserted, the other short and erect Anthoxanthum 64. Inflorescence of 1, several, or many spikes (or spiciform racemes) digitate to racemose; spikelets arranged only on 1 side of the rachis. 69. Inflorescence branches (spikes) scattered along the main axis or sometimes solitaryBouteloua 69. Inflorescence branches digitate, often with additional solitary branches above or below the verticil. 70. Lemma awnless.

71. Reduced florets 1.3–1.5 mm long, truncate, bell-shaped; inflorescence branches generally more than 6
62. Spikelets missing reduced florets or, if present, inconspicuous.
72. Inflorescence 1 spike, a spiciform raceme, or a panicle composed by several spikes or not rebranched racemes.
73. Inflorescence a single terminal spike.
74. Spikelets unilateral (on 1 side) on rachis, 2.5–3.5 mm long, awnless, solitary
74. Spikelets bilateral on rachis, more than 1 cm long, largely awned, 3 per inflorescence
node, the lateral spikelets often reduced to awns
73. Inflorescence composed of 2 to several spikes.
75. Glumes missing; aquatic or subaquatic plants
76. Upper lemma margins inrolled (appearing to clasp) over the palea margins, relatively
thick and rigid, the apex usually obtuse
76. Upper lemma margins folded over the palea margins, relatively thin and flexible, the apex acute or acuminate.
77. Lemma folded and consequently the spikelet appearing to be laterally compressed;
inflorescence with 4 or 5 digitate spikes; plants notably stoloniferous Cynodon
77. Lemma concave-convex and consequently the spikelet appearing dorsoventrally compressed, margins of the lemma conspicuously hyaline; inflorescence usually
subdigitate; plants caespitose, stoloniferous, or rhizomatous Digitaria
72. Inflorescence a spreading or contracted panicle, sometimes spikelike, but primary branches rebranched
(early branches very reduced and the spikelets crowded on sessile or nearly sessile glomerules).
78. Glumes and lemma awnless, the lemma sometimes mucronate.
79. Glumes as long as, or longer than, the lemma.
80. Sheaths of basal leaves folded, conspicuously compressed, carinate; plants 1 m tall or
more
80. Sheaths of the leaves rounded on the back, not compressed or carinate.
81. Glumes 4–10 mm long; panicle spikelike
81. Glumes usually at most 4 mm long, sometimes reaching this length, but then the panicle open or contracted, not appearing spikelike.
82. Rachilla prolonged beyond the insertion of the palea; palea well-developed, ½
as long as the lemma, 2-veined
82. Rachilla usually not prolonged beyond the insertion of the palea; palea miss-
ing or reduced, veinless
79. Glumes, at least the first, shorter than the lemma.
83. Lemma veins densely silky-pubescent; caryopsis ellipsoid, free from floral envelopes
at maturity
compressed, free or united to the floral envelopes at maturity.
84. Lemma 1-veined; caryopsis obovate, notably compressed, free from the floral
envelope at maturity
84. Lemma 3- to 5-veined, sometimes the lateral veins inconspicuous; caryopsis cylin-
drical or slightly compressed, still united to the floral envelope at maturity
78. Glumes or lemmas, or rarely both, awned.
85. Spikelets in groups of 3 at each node of the axis, the central sessile, the lateral ones in the form of bristles
85. Spikelets not in groups of 3, sometimes involucres subtended by bristles.
86. Spikelets in small racemes at the nodes of a narrow and dense panicle, the racemes
subtended by a group of bristles on 1 side, the upper spikelets of racemes naked

87. Lemma awn emerging from the back, or from the middle of the lobes of a deeply 2-toothed apex. 88. Spikelets 6 mm or more long (without the awn), brownish or golden, accompanied at the base by 1 or 2 pedicels from missing spikelets Sorghastrum 88. Spikelets at least 6 mm long (without the awn), stramineous or light green, not accompanied by pedicels from missing spikelets. 89. Awn of glumes longer than lemma awn; spikelets disarticulating below the glumes and falling entire at maturity Polypogon 89. Glumes awnless; spikelets disarticulating above the glumes, which remains attached to the mature inflorescences. 90. Palea missing or reduced when present, veinless; rachilla generally not prolonged beyond the insertion of the palea Agrostis 90. Palea well-developed, 2-veined, ½ as long as the lemma; rachilla prolonged beyond the insertion of the palea Calamagrostis 87. Lemma awn emerging from an entire apex, which can be minutely 2-toothed, or the lemma awnless. 91. Lemma notably hardened, permanently enclosing the palea and caryopsis. 92. Lemma awn divided in 3 branches, the lateral branches sometimes less than 1 mm long Aristida 92. Lemma awn not divided. 93. Palea longitudinally grooved, nearly as long as the lemma, 2-keeled; margins of lemma involute Piptochaetium 93. Palea flat, hidden by the convoluted margins of the lemma. 94. Palea pubescent between the veins; apex of the lemma with hairs not swollen at base and not forming a cylindrical crown 94. Palea glabrous; apex of the lemma with hairs swollen at the base and forming a crown. 95. Apex of lemma prolonged into a smooth crown, cylindrical; palea 1/3 as long as the lemma; awn glabrous or scabrous on the 95. Apex of lemma glabrous; palea as long as the lemma; awn 91. Lemma not notably hardened, not permanently enclosing the palea and caryopsis. 96. Lemma shorter than glumes. 97. Glume awns longer than lemma awn; spikelets disarticulating below the glumes, so falling entire at maturity Polypogon 97. Glume awns missing or shorter than lemma awn; spikelets disarticulating above the glumes, these persistent at maturity Muhlenbergia 96. Lemma as long as, or longer than, glumes Muhlenbergia 25. Spikelets with 2 or more perfect florets or, if unisexual, with 2 or more staminate or pistillate functional florets. 98. Lemma with 9 or more awns or awn-shaped lobes. 99. Awns antrorsely bearded, unequal and interspersed with awned teeth; spikelets 6- to 10-flowered, rachilla 99. Awns forming a crown, not antrorsely bearded or plumose, but never interspersed with awned teeth; spikelets 3- to 6-flowered, falling as a unit; panicle narrow. 100. Spikelets 4- to 6-flowered, with 1 to 3 lower fertile florets; awns numerous, not plumose, unequal in 98. Lemma awnless or up to 3-awned. 101. Plants robust, generally 2–8 m tall; inflorescences as large, generally plumose panicles 30–70 cm long. 102. Lemmas glabrous; rachilla silky; the lowest floret staminate or sterile, persistent, the upper florets fertile

86. Spikelets never subtended by bristles.

102. Lemmas pilose; rachilla glabrous; the florets all alike.
103. Leaves mostly basal, blades narrow, not cordate to clasping below; florets unisexual, the pistillate
florets occasionally with reduced stamens
103. Leaves cauline, the blades cordate to clasping below; florets perfect
101. Plants generally less than 2 m tall; inflorescences varied in shape and length but never a plumose panicle.
104. Spikelets sessile or subsessile; inflorescence a spike, raceme, or a spiciform panicle, the branches
unbranched.
105. Inflorescence a branched panicle, the spikelets placed on 1 side of the rachis of spikes or simple
racemes (not rebranched).
106. Inflorescence with several digitate spikes, whorled or crowded at the apex of culms.
107. Rachis of each branch projecting beyond the spikelets as a rigid tip, 1.5–5 mm long; upper glume awned
107. Rachis not projecting beyond the spikelets; upper glume unawned. 108. Branches of the inflorescence up to 1 cm long; spikelets monoecious, with 2 or 3
staminate florets
108. Branches of the inflorescence 1–12 cm long; spikelets with perfect and sterile florets.
109. Lemma awnless; upper glume 3- to 7-veined, the lateral veins very close to the
central vein; spikelets with 4–10 similar perfect florets
109. Lemma with 1 or 3 awns; upper glume 1-veined; spikelets with 1 basal perfect
floret plus 1 or several reduced sterile florets above.
110. Lemmas lateraly compressed; the perfect lemma 1-awned Chloris
110. Lemmas dorsally compressed; the perfect lemma 3-awned Leptochloa
106. Inflorescence with numerous slender spikes, rarely more than 1 at each node.
111. Spikelets on pedicels at least ½ as long as the spikelet; occasionally some of the primary
branches rebranched; spikelets never in 2 rows along 1 side of the rachis; lemma awnless.
112. Plants with long, scaly rhizomes, 4-8 mm thick; leaf blades arcuate with the apex
sharply pointed
112. Plants without rhizomes or with short, knotty rhizomes less than 4 mm thick, often
stout but never elongated; leaf blades straight without sharp-pointed apex
Eragrostis
111. Spikelets in short pedicels, arranged in 2 rows along the lower side of the rachis; primary
branches unbranched; lemma awned or unawned.
113. Ligules 4–8(15) mm long, apex acute to attenuate, lacerate <i>Diplachne</i> 113. Ligules 0.2–8 (15) mm long, apex usually truncate to obtuse and somewhat erose.
114. Apex of the lemmatal hairs clavicorniculate, ovate to broadly ovate; base of
lemma often indurate and sometimes 5-veined; plants perennial; ligules 0.8–
2.2 mm long, apex erose
114. Apex of the lemmatal hairs ovate to acute, never clavicorniculate; base of
lemma soft and always 3-veined; plants annual or perennial; ligules (0.2)0.5-
5.5(7.0) mm long, apex usually entire.
115. Panicle branches subdigitate, inserted along the rachis usually with 2 or
more branches per node; lemmas 1- to 3-awned or unawned; plants peren-
nial; culms solid; ligule apex ciliate Leptochloa
115. Panicle branches racemosely inserted along the rachis, rarely subdigitate,
usually with a single branch per node; lemmas unawned; plants annual or
perennial; culms solid or hollow; ligule apex never ciliate <i>Dinebra</i>
105. Inflorescence a spike or a solitary raceme, not rebranched.
116. Spikelets arranged on 1 side of the rachis, forming a distinctly unilateral inflorescence
116. Spikelets arranged symmetrically, scattered on both sides of the rachis, forming a bilateral
inflorescence.
117. Lemma with an awn or awns 1.5–10 cm long.
118. Glumes linear to subulate, the awn 3–10 cm long
118. Glumes lanceolate or ovate, awnless or the awn less than 3 cm long.

119. Lemma with 3 awns 3.5–10 cm long; glumes lanceolate, membranous; spikelets with several florets, lower florets reduced usually to awns
Elymus
122. Spikelets solitary at each node of the rachis; glumes narrowly lanceolate to oblong.
123. Glume solitary, except the terminal spikelet; spikelets oriented edgewise against the rachis
104. Spikelets pedicelled; inflorescence an open panicle, sometimes spiciform or racemose-like with branches rebranched.
125. Lemma with a dorsal awn; upper glume more or less the same size or longer than the lemma. 126. Spikelets with 3 florets, the 2 lower florets awned, staminate or sterile; the upper floret perfect, awnless
 129. Lemma with 3 conspicuous veins. 130. Lemma awned; branches of the panicle simple, without secondary branches. 131. Glumes similar in length to the spikelet; inflorescence a compound panicle; spikelets arranged radially in all directions around the rachis Erioneuron 131. Glumes notably shorter than the spikelet; inflorescence a panicle of slender unilateral racemes; spikelets in 2 rows on the lower sides of the rachis
130. Lemma awnless; branches of the panicle with secondary branches. 132. Florets 1–2(3) per spikelet, typically only the lower one perfect; ligules 6–10 mm long, membranous; panicle narrow
excurrent

134. Palea margins not widened or bowed-out below; caryopses dorsally flattened and deeply concave to folded on the dorsal or hilar surface and thickened toward the margin below, surface reticulate, reddish-brown
129. Lemma with 5 or more veins, or without conspicuous veins.
,
135. Rachilla extending as a bristle beyond the upper floret; spikelets with 2(3) florets; endosperm liquid and caryopsis soft; glumes as long or nearly as long as the spikelet.
136. Stamens 2; glumes linear, isomorphic, 1- to 3-veined; lemma awned or awnless, with the apex bilobed; palea narrowly enclosed by the lemma margins <i>Peyritschia</i>
136. Stamens 3; glumes lanceolate, ovate-lanceolate or oblanceolate, heteromorphic, lower glume 1- to 3-veined, upper glume 3- to 5-veined; lemma with 2 to 4 short awns at the apex, or entire, or 2-toothed; palea not narrowly enclosed by the mar-
gins of the lemma.
137. Glumes longer than the lemma, equal or subequal among them; awns of the
lemma originating in the middle or toward the base
with awns near the apex.
138. Upper glume wider below the center; spikelets 2.5–3 mm long, disarticu-
lating below the glumes, spikelets falling entire <i>Sphenopholis</i> 138. Upper glume obovate, wider above the center; spikelets 4–5 mm long, disarticulating above the glumes, glumes persistent on the rachis
Koeleria
135. Rachilla not extending as a bristle beyond the upper floret; spikelets with 3 or more
florets; endosperm solid and caryopsis hardened; glumes shorter than the spikelet.
139. Glumes as long as spikelet, twice as long as the floret, unawned to sometimes
mucronate Schismus
139. Glumes shorter than the spikelet, generally shorter than lemmas.
140. Plants with stolons or elongated rhizomes; florets unisexual on dioecious
plants; plants usually less than 40 cm high.
141. Pistillate and staminate inflorescences consisting of a single spikelet en-
closed and almost concealed by the uppermost leaf sheath Distichlis
141. Pistillate and staminate inflorescences consisiting of more than 1 spikelet,
well-exserted above the uppermost leaf sheath.
142. Glumes and lemmas ovate, acute to obtuse at the apex; plants with
scaly and creeping rhizomes <i>Distichlis</i> (staminate or pistillate) 142. Glumes and lemmas lanceolate, long attenuate at the apex; plants without scaly rhizomes <i>Scleropogon</i> (staminate)
140. Plants lacking stolons and elongated rhizomes; florets perfect; plants of vary-
ing sizes.
143. Sheaths with united margins, at least on the lower ½ or ⅓.
144. Spikelets strongly compressed on dense 1-sided panicle branches;
sheaths keeled and laterally compressed
144. Spikelets not strongly compressed on dense 1-sided panicle branches;
sheaths terete.
145. Lemmas 7-veined, veins almost parallel, not converging at the
truncate or rounded apex
145. Lemmas 3- to 7-veined, veins converging at the obtuse or acute
apex, when parallel then less than 7.
146. Upper florets empty, inrolled and reduced to a rudiment; glumes chartaceous or papery
146. Upper florets not empty or reduced to a rudiment; glumes
usually membranous and not chartaceous or papery.
147. Spikelets awned or unawned, when awnless then at
least 15 mm long Bromus

147. Spikelets awnless, generally shorter than 10 mm long
Poo
143. Sheaths with free margins down to the base.
148. Lemma awned.
149. Sheaths without auricles Festuca
149. Sheaths with auricles, the apex ciliolate Lolium
148. Lemma unawned.
150. Lemma less than 4 mm long; plants usually less than 80 cm tal
Pod
150. Lemma at least 5.5 mm long; plants often greater longer than
1 m tall.
151. Sheaths lacking auricles Festuce
151 Sheathe with auricles the apex ciliplate Lalium

DESCRIPTIONS

Achnatherum P. Beauv.

Perennial; tightly to loosely caespitose, sometimes short rhizomatous. Culms erect, not branching at the upper nodes. Leaves sometimes concentrated at the base; sheaths open, margins often ciliate distally; ligules hyaline to membranous, glabrous or pubescent, sometimes ciliate; blades flat, convolute, or involute, apex acute, flexible, basal blades not overwintering. Inflorescences terminal panicles, usually contracted, sometimes 2 forming at the terminal node. Spikelets usually appressed to the branches, with 1 floret; disarticulation above the glumes, beneath the floret. Glumes exceeding the floret, usually lanceolate, 1- to

7-veined, acute to acuminate, sometimes obtuse; florets usually terete, fusiform or globose, sometimes laterally compressed; lemmas smooth, usually hairy, sometimes glabrous, hairs to 6 mm long, usually terminating in lobes, sometimes unlobed, apex with a single, terminal, centric awn, awn-lemma junction evident; awns centric, readily deciduous to persistent, usually scabrous to scaberulous, sometimes hairy in whole or in part, if shorter than 12 mm long, usually deciduous, not or once-geniculate and sparsely twisted, if longer than 12 mm long, usually persistent, once- or twice-geniculate and twisted below, terminal segment usually straight, sometimes flexuous; paleas from $\frac{1}{3}$ as long as to slightly longer than the lemmas, usually pubescent; anthers 3, 1.5–6 mm long, sometimes penicillate. Caryopsis fusiform, not ribbed, style bases persistent. x = 10 or 11.

KEY TO SPECIES OF ACHNATHERUM

1. Basal blades curling with age, forming circular arcs; paleas ¼-⅓ as long as the lemmas; panicles 7–11 cm long
A. curvifolium
1. Basal blades straight to lax, not forming circular arcs; paleas 1/2-4/3 as long as the lemmas; panicles 5-30 cm long.
2. Lemma silky pilose, hairs 3 mm long; lemma awn deciduous, straight, never twisted, rarely geniculate, generally less than
3 to 4 times as long as the grain
2. Lemma glabrous to white-pubescent, hairs less than 1.5 mm long; lemma awn persistent, twisted and geniculate, several
times longer than the grain.
3. Lower glume 6-8(9) mm long; inflorescence branches generally ascending or plicate; culms with 3 to 4(5) nodes
A. multinode
3. Lower glume (8)10–16 mm long; inflorescence branches open or ascending; culms with 2 to 3 nodes.
4. Inflorescence highly diffuse; lemma awn 34–68 mm long
4. Inflorescence a spike; lemma awn (20)23–40 mm long

1. Achnatherum curvifolium (Swallen) Barkworth, Phytologia 74(1): 7. 1993. Stipa curvifolia Swallen, J. Was. Acad. Sci. 23(10): 456. 1933.

FIGURE 2

Plants tightly caespitose, not rhizomatous. Culms 25–55 cm tall, 0.7–1 mm thick, glabrous; nodes 3. Basal sheaths usually puberulent, hairs 0.1–0.2 mm long, sometimes densely tomentose at the base, brown to gray-brown when old; collars glabrous,

sometimes with tufts of hair on the sides, hairs to 0.5 mm; ligules 0.3–0.6 mm long, truncate, pubescent, hairs about 0.1 mm; blades normally valvate to involute, about 0.5 mm in diameter, strongly arcuate, abaxial surfaces pubescent near the base, glabrous and smooth distally, adaxial surfaces densely hairy, hairs to 0.2 mm. Panicles 7–11 cm long, 1–2 cm wide; branches appressed to strongly ascending, longest branches 3–4 cm. Glumes subequal, 10–14 mm long, 0.7–0.9 mm wide; florets 6–8 mm long, 0.4–0.8 mm thick, fusiform, terete; calluses 1–1.5 mm

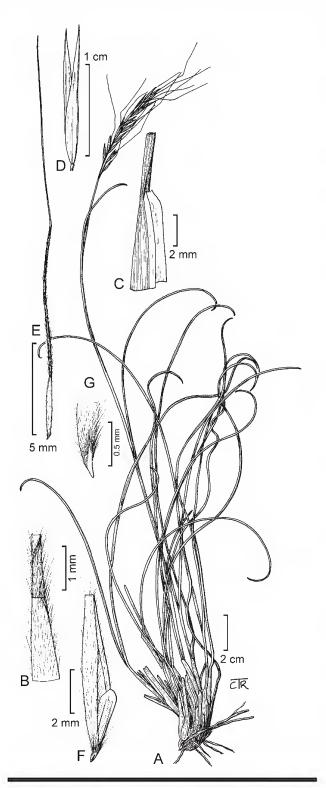

FIGURE 2. *Achnatherum curvifolium.* A. Habit. B. Apex of lemma. C. Ligule. D. Glumes. E. Floret. F. Lemma and palea. G. Callus. Drawn by Cindy Roché; copyright Utah State University.

long, sharp; lemmas evenly hairy, hairs at midlength 0.3–1 mm long, apical hairs 1–1.5 mm long, apical lobes not developed; awns 22–38 mm long, once-geniculate, first segment pubescent, hairs 1–2 mm long, gradually decreasing in length distally; paleas 2–2.3 mm long, $\frac{1}{4}$ – $\frac{1}{3}$ as long as the lemmas, glabrous; anthers about 3.5 mm long, dehiscent, not penicillate. Caryopsis about 4 mm long, fusiform. 2n = 44.

DISTRIBUTION AND HABITAT. Achnatherum curvifolium grows on cliffs and in disturbed, rocky, limestone habitats. It is reported from United States and northern Mexico. It is most readily distinguished from other species of the genus by its combination of curly leaves and hairy awns.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

Achnatherum eminens (Cav.) Barkworth, Phytologia 74(1):
 1993. Stipa eminens Cav., Icon. 5: 42, t. 467, f. 1. 1799.

FIGURE 3

Plants caespitose, short rhizomatous, bases knotty. Culms 50-100 cm tall, 0.8-1.5 mm thick, glabrous; nodes 2-3. Basal sheaths mostly glabrous, ciliate on the margins; collars glabrous on the back, usually with tufts of hair on the sides, hairs about 0.8 mm; ligules 1-4.5 mm long, membranous, glabrous, rounded to acute; blades 0.7-3.5 mm wide, abaxial surfaces smooth to scaberulous, adaxial surfaces prominently ribbed, scaberulous or sparsely to densely pubescent, hairs about 0.1 mm. Panicles 20-55 cm long, 3-8 cm wide, open, often enclosed to midlength at anthesis; lower branches 5-8 cm long, ascending to divergent, flexuous. Lower glumes 5-12 mm long, 0.5-0.7 mm wide, 3- to 5-veined; upper glumes 1-4 mm shorter, 3-veined; florets 4-7.5 mm long, 0.5-0.9 mm thick, fusiform, terete; calluses 1-2 mm long, sharp; lemmas evenly hairy, hairs 0.4-0.8 mm throughout, apical lobes not present; awns 35-70 mm long, persistent, twice-geniculate, first 2 segments scabrous, terminal segment flexuous; paleas 1–2 mm long, 1/3–1/2 as long as the lemmas, sparsely to moderately pubescent, apex rounded, flat; anthers 3–3.5 mm long, dehiscent, a few penicillate, hairs about 0.3 mm. Caryopsis about 4 mm long, fusiform. 2n = 44, 46.

DISTRIBUTION AND HABITAT. Achnatherum eminens grows on dry, rocky slopes and valleys in the mountains; its range extends from the southwest United States to Mexico, primarily in desert scrub. It is easy to recognize because of its open panicle, flexuous branches, and flexuous awns.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Aquiles Serdán: Between the higher and the lower parts of Aquiles Serdán, 8 Jul 1972, 1900 m, F. Chiang, T.L. Wendt & M.C. Johnston 8353B (MEXU). FIGURE 4

Plants tightly caespitose, not rhizomatous. Culms 25-70 cm tall, 0.7-1.3 mm thick, glabrous or partly scaberulous; nodes 3-4. Sheaths glabrous or scaberulous, sometimes puberulent on the distal margins, hairs to 0.8 mm; collars glabrous, sometimes with tufts of hair on the sides, hairs to 1 mm; ligules 1.5-4 mm long, hyaline, glabrous, acute; blades usually convolute, 0.1-1 mm in diameter, abaxial surfaces smooth or scaberulous, adaxial surfaces pubescent. Panicles 9-20 cm long, 8–14 cm wide; branches ascending to strongly divergent, longest branches 3-15 cm; pedicels paired, conspicuously divaricate, shorter pedicels in each pair usually at least ½ as long as the longer pedicels. Glumes subequal, 5-9 mm long, 0.8-2 mm wide, saccate below, puberulent, hairs about 0.1 mm long, tapering above midlength, apex acuminate; lower glumes 5-veined at the base, 3-veined at midlength; upper glumes 5- to 7-veined at the base; florets 3-4.5 mm long, 1-2 mm thick, obovoid; calluses 0.4-1 mm long, sharp; lemmas indurate, densely and evenly pilose, hairs 2.5-6 mm long, easily rubbed off, apex not lobed; awns 3-6 mm long, rapidly deciduous, not geniculate, scabrous; paleas subequal to the lemmas in length and texture, glabrous, apex pinched; anthers 1.5-2 mm long, penicillate, dehiscent, well-filled. Caryopsis 2–3 mm. 2n = 46, 48.

DISTRIBUTION AND HABITAT. Achnatherum bymenoides grows in dry, well-drained soils, primarily in the western part of the United States and northern Mexico. The roots of A. bymenoides are often surrounded by a rhizosheath formed by mucilaginous secretions to which soil particles attach. This rhizosheath harbors nitrogen-fixing organisms that probably contribute to the success of the species as a colonizer.

Plants caespitose, not rhizomatous. Culms 60–120 cm tall, 1.5-3.5 mm thick, erect, mostly glabrous; nodes 2-4. Basal sheaths mostly glabrous, distally ciliate; collars hairy, hairs 1 mm; ligules 0.5-3 mm; a lacerate scale, glabrous; blades 1-1.3 mm wide, firm, rigid, flat and involute toward the apex when mature. Panicles 10-20 cm long, 0.8-1.5 cm wide; branches 1-3(6) cm long, straight, appressed to ascending. Glumes subequal, 6–8(9) mm long, pale hyaline, acuminate, 1- to 3-veined, glabrous; florets 4.5-5.5 mm long, 0.6-0.9 mm thick, fusiform, terete; calluses 0.3-0.5 mm long, barbed; lemmas white-pubescent, hairs 0.5 mm long, apical hairs to 1.5 mm; awns 20-35 mm long, persistent, twice-geniculate, first segment 3.5-8 mm long, glabrous to scabrous, second segment 4-5.5 mm long, terminal segment 18-20 mm long, straight; paleas 3.5-4.6 mm long, ¾ as long as the lemmas, hairy, hairs about 0.5 mm long, not exceeding the apex; anthers 2.5-3.5 mm long.

DISTRIBUTION AND HABITAT. Achnatherum multinode grows on dry plains and hills, in open woods and forest clearings, and along roadsides, from the western United States to northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Jiménez: Sta Eulalia Mts, Aug 1885, C.G. Pringle 385 (US), isotype; E. Wilkinson 349 (US).

 12. 1993. Stipa viridula var. robusta Vasey, Contr. U.S. Natl. Herb. 1(2): 56. 1890.

FIGURE 5

Plants caespitose, not rhizomatous. Culms 100-230 cm tall, 2-4.5 mm thick, mostly glabrous, often pubescent below the nodes, the pubescence antrorse or retrorse; nodes 4-5. Basal sheaths mostly glabrous, margins usually ciliate distally; collars hairy, hairs 0.5-2 mm; ligules (1)2-4 mm; truncate, rounded, or obtuse, glabrous; blades 6-10 mm wide, glabrous, abaxial surfaces smooth, adaxial surfaces prominently ribbed, ribs scabrous. Panicles 15-30 cm long, 0.8-3.5 cm wide; branches straight, appressed to ascending, lower branches 3-9 cm. Spikelets appressed to the branches. Glumes subequal, 9-11.5 mm long, 1-1.4 mm wide; florets 5.9-8.5 mm long, 0.9-1.2 mm thick, fusiform, terete; calluses 0.3-1 mm long, blunt; lemmas evenly hairy, hairs at midlength 0.3-0.8 mm long, apical hairs to 1.5 mm; awns 20-32 mm long, persistent, twice-geniculate, scaberulous to scabrous, hairs to about 0.1 mm long, longest on the middle segment, terminal segment straight; paleas 3.7-5.6 mm long, ²/₃-³/₄ as long as the lemmas, hairy, hairs about 0.5 mm long, not exceeding the apex, veins terminating below the apex, apex rounded; anthers 4-5 mm long, dehiscent, penicillate. Caryopsis 5–6 mm. 2n = 64.

DISTRIBUTION AND HABITAT. Achnatherum robustum grows on dry plains and hills, in open woods and forest

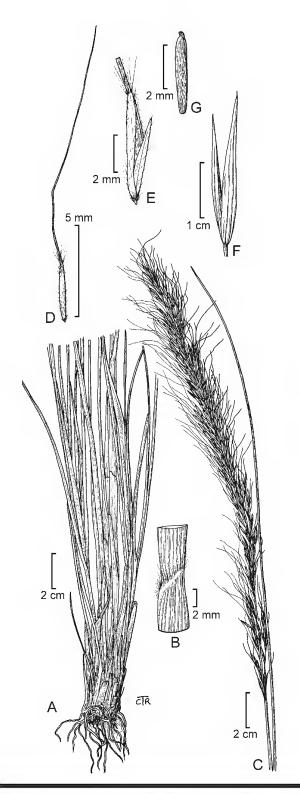

FIGURE 5. Achnatherum robustum. A. Habit. B. Ligule. C. Inflorescence. D. Floret. E. Spikelet. F. Glumes. G. Caryopsis. Drawn by Cindy Roché; copyright Utah State University.

clearings, and along roadsides, from the western United States to northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

Aegilops L.

Annual. Culms usually glabrous, erect or geniculate at the base, with 2-4(5) nodes. Sheaths open; auricles ciliate; ligules membranous, truncate; blades, linear to linear-lanceolate, flat, spreading. Inflorescence terminal, spikes, with 2-13 spikelets, usually with 1-3 rudimentary spikelets at the base; disarticulation either at the base of the spikes or in the rachis, the spikelets falling attached to the internodes above or below. Spikelets solitary at each node, ½-2(3) times the length of the internodes, tangential to the rachis, appressed or ascending, upper spikelet(s) sometimes sterile; bisexual spikelets with 2-7 florets, distal florets often sterile. Glumes ovate to rectangular, rounded on the back, scabrous or pubescent, with several prominent veins, midveins smooth throughout, apex truncate, denticulate, or awned, sometimes indurate at maturity; lemmas rounded on the back, apex toothed, frequently awned; paleas chartaceous, 2-keeled, keels ciliate; anthers 3, not penicillate; ovaries with pubescent apex. Caryopsis lanceolate to lanceolate-ovate. x = 7.

Aegilops has about 23 species and is native from the Mediterranean region to central Asia, as well as in the Canary Islands; only 1 species occurs in Chihuahua.

6. Aegilops cylindrica Host, Icon. Descr. Gram. Austriac. 2: 6, pl. 7. 1802.

FIGURE 6

Culms 14-50 cm tall, erect to decumbent at the base, usually with many tillers. Sheaths with hyaline margins, sometimes ciliate; blades 3-15 cm long, 2-5 mm wide. Spikes 2.2-12 cm long, about 0.3 cm wide, narrowly cylindrical, 10-45 times longer than wide, with (2)3-8(12) bisexual spikelets; rudimentary spikelets absent or 1-2; disarticulation initially at the base of the spikes and secondarily in the rachises, the spikelets remaining attached to the internodes above. Spikelets 9-12 mm long, narrowly cylindrical, scabrous or pubescent, all fertile, with 3-5 florets, lower (1)2-3 florets fertile. Glumes of lower spikelets awned, awns 0.2-0.5 cm; glumes of apical spikelets 7-9 mm long, scabrous, apex with a 3-6 cm awn usually flanked by 2 lateral teeth; lemmas of lower spikelets 9-10 mm long, adaxial surfaces velutinous distally, apex mucronate or awned, awns 0.1-0.5 cm; lemmas of apical spikelets 1-awned, awns 4-8 cm long, flanked by 2 teeth. Caryopsis 6–7 mm long, adhering to the lemmas and paleas. 2n = 28.

DISTRIBUTION AND HABITAT. Aegilops cylindrica is a widespread weed in North America, being particularly troublesome in winter wheat. It usually grows in disturbed sites such as roadsides, fields, and along railroad tracks. It is native

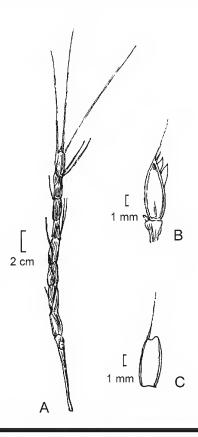

FIGURE 6. Aegilops cylindrica. A. Inflorescence. B. Spikelet, ventral view. C. Glume. Drawn by Cindy Roché; copyright Utah State University.

to the Mediterranean region and central Asia and is adventive in other temperate countries. It is reported from Mexico only from specimens cultivated in an experimental station (Rancho La Campana); 38 years later, this species has not been collected again in Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Rancho Experimental La Campana, 17 May 1975, Jardín de Observación de zacates [grass observation garden], 1500 m, *Valdés-Reyna VR899* (RELC).

Agropyron Gaertn.

Perennial; densely to loosely caespitose, sometimes rhizomatous. Culms geniculate or erect. Sheaths open; auricles usually present; ligules membranous, often erose. Inflorescences spikes, usually pectinate. Spikelets solitary, usually more than 3 times as long as the internodes, divergent or spreading from the rachis, with 3–16 florets; disarticulation above the glumes and beneath the florets. Glumes shorter than the adjacent lemmas, ovate to lanceolate, 1- to 5-veined, asymmetrically keeled, a secondary

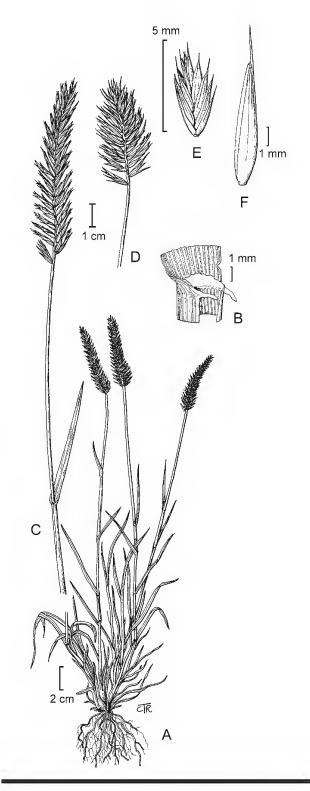

FIGURE 7. Agropyron cristatum. A. Habit. B. Ligule. C. Culm and inflorescence. D. Inflorescence. E. Spikelet. F. Lemma. Drawn by Cindy Roché; copyright Utah State University.

keel sometimes present on the wider side, keels glabrous or with hairs, hairs not tufted, apex acute and entire, sometimes awned, awns to 6 mm; lemmas 5- to 7-veined, asymmetrically keeled, acute to awned, awns to 4.5 mm; paleas from slightly shorter than to exceeding the lemma, bifid; anthers 3, 3–5 mm long, yellow. Caryopsis usually falling with the lemmas and paleas attached. x = 7.

Agropyron, it is now agreed, should be restricted to perennial species of Triticeae with keeled glumes, that is, Agropyron cristatum and its allies.

7. Agropyron cristatum* (L.) Gaertn., Novi Comment. Acad. Sci. Imp. Petrop. 14: 540. 1770.

FIGURE 7

Plants occasionally rhizomatous. Culms 25-110 cm tall, sometimes geniculate. Ligules to 1.5 mm; blades 1.5-6 mm wide, glabrous or pubescent. Spikes 1.3-10.5(15) cm long, 5-25 mm wide, narrowly to broadly lanceolate, rectangular, or ovate, sometimes tapering distally; internodes 0.7-5(8) mm long, glabrous or pilose, sometimes all more or less equal, sometimes short and long internodes alternating within a spike, basal internodes often longer than those at midlength. Spikelets 7-16 mm long, diverging at angles of 30°-95° at maturity, with 3-6(8) florets. Glumes 3-6 mm long, glabrous or with coarse hairs on the keels, acute, usually awned, awns 1.5-3 mm; lemmas 5-9 mm long, glabrous or with hairs, keeled, keels sometimes scabrous distally, apex acute, usually awned, awns 1-6 mm; anthers 3-5 mm. 2n = 14, 28, 42.

DISTRIBUTION AND HABITAT. Agropyron cristatum is native from central Europe and the eastern Mediterranean to Mongolia and China and is introduced in the Americas. We recognize a broad concept for this taxon and include A. cristatum subsp. desertorum (Fisch. ex Link) Á. Löve under this highly variable species.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: 1.1 km N of San Juanito near large lumber mill, 24 Sep 1988, 2200 m, P.M. Peterson & Annable 5867 (ENCB, US); La Campana, 24 Sep 76, Jardines de Observación Forrajera [forage observation gardens], 1500 m, S. González 774 (RELC).

Agrostis L.

Plants usually perennial, caespitose, sometimes rhizomatous or stoloniferous. Culms usually erect. Sheaths open, usually smooth and glabrous; ligules membranous, smooth or scaberulous dorsally, apex truncate, obtuse, usually erose to lacerate, or entire; blades flat, folded, or involute, usually smooth and glabrous. Inflorescences terminal panicles, narrowly cylindrical and dense to open and diffuse; branches usually in whorls. Spikelets pedicellate, laterally compressed, lanceolate to narrowly oblong or ovate, with 1(2) florets; rachillas not prolonged beyond the base of the floret(s); disarticulation above the glumes, beneath the florets. Glumes 1-2(4) times longer than the lemmas, 1(3)-veined, glabrous, usually mostly smooth, apex acuminate to awn-tipped; lower glumes usually 0.1-0.3 mm longer than the upper glumes, rarely equal; lemmas thinly membranous to hyaline, usually smooth and glabrous, sometimes scaberulous, 3- to 5-veined, unawned or awned, awns arising from near the lemma bases to near the apex, usually geniculate, sometimes straight; paleas absent or minute to subequal to the lemmas, usually thin, veins not or only weakly developed; anthers 3, not penicillate; styles 2, free to the base, white; ovaries glabrous. Caryopsis with a hard, soft, or liquid endosperm. x = 7.

KEY TO SPECIES OF AGROSTIS

- 1. Prostrate herbs with decumbent culms, stoloniferous; palea evident, 2-veined, at least ½ of the lemma length 1. Erect herbs, culms not forming stolons; palea absent or minute, reduced to a small scale, rarely longer than 1/3 of the lemma 2. Panicle narrow, laxly cylindrical or spiciform, 5–10 times longer than wide, the branches erect or ascending ... A. exarata 2. Panicle highly branched, diffuse, almost as long as wide at maturity, the branches spread.
 - 3. Culms 60–100 cm tall; spikelets 2–3.1 mm long; glumes 2–2.6(3) mm long. 4. Rhizomatous plants; blades basal and cauline; anthers 1-1.3 mm; caryopsis 1-1.2 mm long, endosperm solid
 - 4. Caespitose plants; blades mostly basal; anthers 0.4–0.8 mm; caryopsis 0.9–1.4 mm long, endosperm liquid

8. Agrostis exarata Trin., Gram. Unifl. Sesquifl. 207. 1824.

FIGURE 8

Perennial; usually caespitose, sometimes rhizomatous, not stoloniferous. Culms 8-100 cm tall, erect or decumbent at base, sometimes rooting at the lower nodes, with (2)3-6 nodes. Leaves mostly cauline; sheaths smooth or slightly scabrous; ligules (1)1.7–8 mm long, dorsal surfaces scabrous, apex truncate to obtuse, lacerate to erose; blades 4-15 cm long, 2-7 mm wide, flat. Panicles (3)5-30 cm long, 0.5-4 cm wide, contracted, spikelike, oblong, or lanceolate, usually dense, rarely more open, sometimes interrupted near base, bases usually exserted, rarely enclosed by

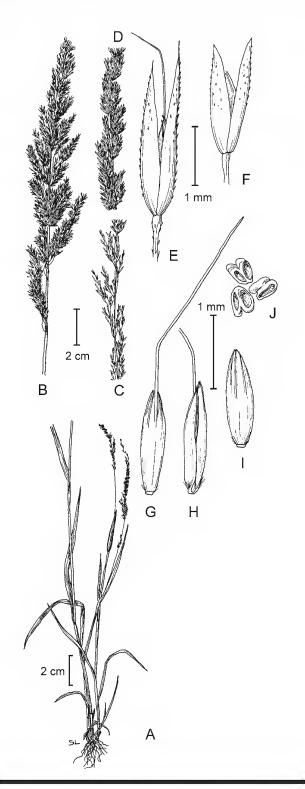

FIGURE 8. Agrostis exarata. A. Habit. B. Inflorescence. C. Inflorescence. D. Inflorescence. E. Spikelet. F. Spikelet. G. Floret, dorsal view. H. Floret, ventral view. I. Floret, dorsal view. J. Anthers. Drawn by Sandy Long; copyright Utah State University.

the upper sheaths at maturity, lowest node with 1–5 branches; branches scabrous, ascending to appressed, spikelet-bearing to or near the base, usually hidden by the spikelets, spikelets crowded, lower branches 1–2(4) cm; pedicels 0.2–4.3 mm. Spikelets lanceolate to narrowly ovate, greenish to purplish. Glumes subequal to equal, 1.5–3.5 mm long, scabrous on the midvein and sometimes on the back, 1(3)-veined, acute, elongate-acuminate, with an awn-like tip to 1 mm; callus hairs to 0.3 mm long, sparse to abundant; lemmas 1.2–2.2 mm long, smooth, translucent to opaque, 5-veined, veins prominent distally or obscure throughout, apex acute, entire or toothed, teeth no more than 0.12 mm long, unawned or awned from above midlength, awns to 3.5 mm long, straight or geniculate; paleas absent or to 0.5 mm; anthers 3, 0.3–0.6 mm. Caryopsis 0.9–1.2 mm; endosperm solid or soft. 2n = 28, 42, 56.

DISTRIBUTION AND HABITAT. Agrostis exarata is common and widely distributed in western North America, usually growing in moist ground in open woodlands, river valleys, tidal marshes, and swamp and lake margins; it also grows in dry habitats such as grasslands and shrublands. It extends from Alaska into Mexico.

Agrostis hyemalis (Walter) Britton, Sterns & Poggenb., Prelim. Cat. 68. 1888. Cornucopiae hyemalis Walter, Fl. Carol. 73. 1788.

FIGURE 9

Perennial or facultative annual; caespitose, not rhizomatous or stoloniferous. Culms 15–82 cm tall, erect, with (3)4–7 nodes. Leaves cauline and basal; sheaths smooth; ligules (0.7)1.2–4 mm long, dorsal surfaces scabrous, apex usually rounded to truncate, sometimes acute, lacerate-erose; blades 3–10 cm long, 1–2 mm wide, flat, becoming involute, or folded. Panicles (5)10–25(36) cm long, (3)4–24 cm wide, broadly ovate, often nearly as wide as long, diffuse, the whole panicle often detaching at base when mature, forming a tumbleweed, bases often enclosed by the upper sheaths, lowest node with (3)5–11 branches; branches scabrous, capillary, flexible, wide-spreading, branching in the distal ¼, spikelets strongly clustered at the branch tips, lower branches 5–15 cm; pedicels 0.1–2.5(3.5) mm. Spikelets ovate to

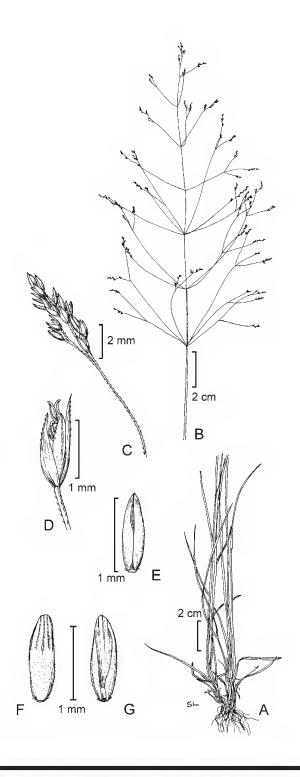

FIGURE 9. Agrostis byemalis. A. Habit. B. Inflorescence. C. Inflorescence branch. D. Spikelet. E. Floret. F. Floret, dorsal view. G. Floret, ventral view. Drawn by Sandy Long; copyright Utah State University.

narrowly ovate, greenish or purplish. Glumes subequal, 1–2 mm long, 1-veined, keeled, keels scabrous, sometimes the body also scabrous toward the apex, acute to acuminate; callus hairs to 0.2 mm long, sparse; lemmas 0.8–1.2 mm long, scaberulous, translucent to opaque, 5-veined, veins obscure or prominent distally, apex usually obtuse, sometimes acute, entire, unawned; paleas absent or to 0.2 mm and thin; anthers 3, 0.2–0.5 mm. Caryopsis 0.7–1 mm. 2n = 28.

DISTRIBUTION AND HABITAT. Agrostis hyemalis is most abundant along roadsides and in open pastures, scrub, and rocky areas. It is centered in the southeastern United States to the Caribbean, Mexico, and Ecuador.

10. Agrostis scabra Willd., Sp. Pl. 1(1): 370. 1797.

FIGURE 10

Perennial or annual; caespitose. Culms (7.5)15-90 cm tall, erect, nodes usually 1-3. Leaves mostly basal, basal leaves usually persistent; sheaths usually smooth, sometimes scaberulous; ligules 0.7-5 mm long, dorsal surfaces scabrous, apex usually rounded, sometimes truncate or acute, erose-ciliolate to lacerate; blades 4-14 cm long, 1-2 mm wide, basal blades mostly involute, cauline blades mostly flat. Panicles (4)8-25(50) cm long, 0.5-20 cm wide, broadly ovate, often nearly as wide as long, diffuse, the whole panicle often detaching at base when mature, forming a tumbleweed, exserted from the upper sheaths, lowest node with (1)2–7(12) branches; branches scabrous, capillary, flexible, wide-spreading, readily visible, branching beyond midlength, spikelets somewhat distant, not crowded, lower branches 4-12 cm; pedicels 0.4-9.6 mm. Spikelets lanceolate, greenish purple, frequently purple when mature. Glumes unequal, 1.8-3.4 mm long, lanceolate, 1-veined, keels scabrous at least toward the apex, apex acuminate; callus hairs to 0.2 mm long, sparse; lemmas 1.4-2 mm long, scabrous to scaberulous or smooth, translucent to opaque, 5-veined, veins prominent, apex acute to obtuse, usually entire, sometimes minutely toothed, awned or awnless from below midlength, awns 0.2-3 mm long, exceeding

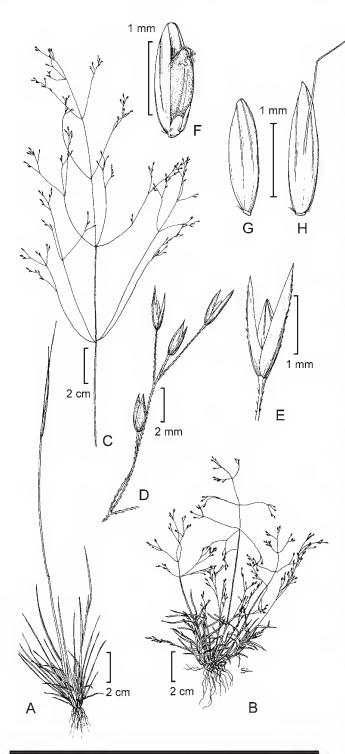

FIGURE 10. Agrostis scabra. A. Habit. B. Habit, dwarf form. C. Inflorescence. D. Inflorescence branch. E. Spikelet. F. Floret with caryopsis. G. Lemma, side view. H. Lemma, dorsal view. Drawn by Sandy Long; copyright Utah State University.

the lemma apex by up to 2.5 mm long, geniculate or straight, persistent; paleas absent or to 0.2 mm; anthers 3, 0.4–0.8 mm long, usually shed at anthesis. Caryopsis 0.9–1.4 mm; endosperm liquid. 2n = 42.

DISTRIBUTION AND HABITAT. Agrostis scabra grows in grasslands, meadows, shrublands, woodlands, marshes, and stream and lake margins as well as disturbed sites such as roadsides, ditches, and abandoned pastures. It occurs in the southeastern United States to Mexico; it is also native to the Pacific coast from Kamchatka to Japan and Korea and has been introduced elsewhere (Harvey, 2007).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Yamuco at 1 km E of Hwy towards Basihuare and Creel, N of Rio Urique crossing, 26 Aug 2003, slopes with pines and oaks, 1891 m, P.M. Peterson & P. 11. Agrostis stolonifera L. var. palustris* (Huds.) Farw.

FIGURE 11

Perennial; caespitose, stoloniferous. Culms 8–40 cm tall, smooth, geniculately ascending, or decumbent, rooting from lower nodes. Sheaths glabrous; ligule 1–6 mm long, an eciliate membrane, obtuse; blades 1–10 cm long, 0.5–5 mm wide, surface ribbed, scaberulous, apex acuminate. Panicle 1–13 cm long, 0.4–2.5 cm wide, open, or contracted, linear, lanceolate or oblong, continuous or interrupted, dense or loose; primary panicle branches whorled at most nodes, scabrous. Spikelets 2–3 mm long, solitary, terete, lanceolate, or oblong, laterally compressed, fertile spikelets pedicelled, pedicels filiform, 0.5–2 mm long,

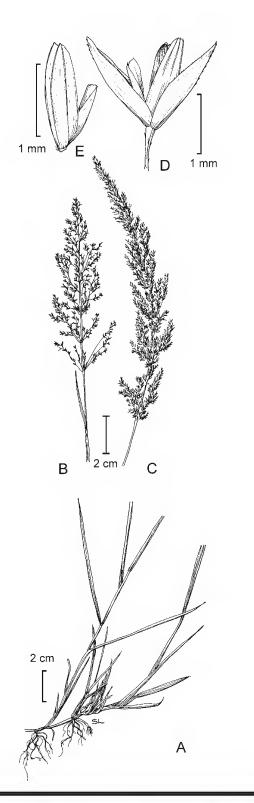

FIGURE 11. Agrostis stolonifera. A. Habit. B. Inflorescence. C. Inflorescence. D. Spikelet. E. floret. Drawn by Sandy Long; copyright Utah State University.

comprising 1 fertile floret, disarticulating below each fertile floret. Glumes exceeding florets, persistent, similar, firmer than lemma, shiny, 1-keeled, 1-veined, lanceolate; lemma 1.5–2.3 mm long, elliptic to oblong, hyaline, 5-veined, apex obtuse; callus pubescent; palea 1.0–1.8 mm long, 2-veined, oblong, apex obtuse; anthers 3, 1–1.5 mm. Caryopsis with adherent pericarp, ellipsoid, isodiametric, biconvex, estipitate, smooth.

DISTRIBUTION AND HABITAT. Agrostis stolonifera var. palustris grows on saline soils; there exists a collection from humid depressions in gypsum areas. Native in Eurasia, it is introduced as forrage in America, north of Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000).

12. *Agrostis subrepens* (Hitchc.) Hitchc., N. Amer. Fl. 17(7): 525, 1937.

Perennial; with delicate rhizomes. Culms 60–100 cm tall, erect, glabrous, with 2–4 nodes, the superior node near the middle of the culm. Sheaths glabrous; ligule 1–2 mm; blades 3–5 cm long, 1–1.3(1.8) mm wide, inrolled, scabrous, slender, apex hard and acute, superior blades above ½ culm. Panicle 12–18(22) cm long, 5–10 cm wide, open, pyramidal, axis glabrous, and the branches lightly scaberulous, slender, widely spread, on verticils or 1–2 per node, verticils 2–4 cm apart, lower branches 5–8 cm. Spikelets 2.5–2.8 mm long, brown to purple, grouped along the superior part of branches. Glumes 2.5–2.8 mm long, acuminate, scarcely scabrous along the keel; lemmas 1.8–2 mm long, hyaline, veinless, entire, obtuse to apiculate, awnless, callus scarcely pilous; palea rudimentary; anthers 3, 1–1.3 mm long, yellow. Caryopsis 1–1.2 mm long, ovate, flat, hard, brown.

DISTRIBUTION AND HABITAT. Agrostis subrepens grows in meadows and stream margins in Mexico and South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Base of Sierra Madre, 28 Sep 1887, C.G. Pringle 1420 (US), holotype. Casas Grandes: W of Casas Grandes, just S of Hernández, 18 Sep 1960, 7000 ft, Reeder, C. Reeder & Soderstrom 3535 (US). Madera: Chuichupa, Aug-Sep 1936–37, LeSueur 087, 0198 (US); near Col. García, 1 Aug 1899, E.W. Nelson 6195 (US).

Alopecurus L.

Annual or perennial; sometimes short rhizomatous, caespitose or occasionally the culms solitary. Culms erect or decumbent, occasionally cormlike at the base; nodes glabrous. Leaves inserted mostly on the lower ½ of the culms; sheaths open; ligules truncate to acute, membranous, dorsally puberulent or glabrous, entire to lacerate; blades flat or involute, glabrous or scabrous, those of the uppermost leaves sometimes short or absent. Inflorescences terminal spikelike, capitate to cylindrical; disarticulation below the glumes. Spikelets pedicellate, strongly laterally compressed, with 1 floret; rachilla prolongations absent. Glumes equaling or exceeding the florets, membranous or coriaceous, free or connate basally to more than ½ their length, 3-veined,

keeled, keels ciliate, at least basally, apex obtuse to acute or shortly awned; calluses blunt, glabrous; lemmas membranous, margins often connate basally to $\frac{1}{2}$ their length, keeled, indistinctly 3- to 5-veined, apex truncate to acute, awned dorsally, awns arising from just above the base to about midpoint, geniculate or straight; paleas absent or greatly reduced; lodicules absent; anthers 3; ovaries glabrous; styles fused, with 2 branches. Caryopsis glabrous. x = 7.

13. Alopecurus geniculatus* L., Sp. Pl. 1: 60. 1753.

FIGURE 12

Perennial; caespitose. Culms (5)10–60 cm tall, erect or decumbent, rooting at the nodes. Ligules 2–5 mm long, obtuse; blades 2–12 cm long, 1–4(7) mm wide; upper sheaths somewhat inflated. Panicles 1.5–7 cm long, 4–8 mm wide. Glumes 1.9–3.5 mm long, connate at the base, membranous, pubescent, keels not winged, ciliate, apex obtuse, parallel, often purplish; lemmas 2.5–3 mm long, connate in the lower ½, glabrous or with a few scattered hairs at the apex, apex truncate to obtuse, awns 3.5–5(6) mm long, geniculate, exceeding the lemmas by (1.2)2–4 mm; anthers (0.9)1.4–2.2 mm long, yellow. Caryopsis 1–1.5 mm. 2n=28.

DISTRIBUTION AND HABITAT. Alopecurus geniculatus is native to Eurasia and parts of North America, growing in shallow water, ditches, open wet meadows, shores, and stream banks from the lowland to montane zones. It has been naturalized in eastern North America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: 1.1 km N of San Juanito near large lumber mill, 24 Sep 1988, 2200 m, *P.M. Peterson & Annable 5870* (ENCB, US). Chihuahua: Bajio del Rancho Experimental La Campana, Aug 1958, Pastizal [pastureland], *F. Martínez 117* (RELC, US).

Andropogon L.

Annual or perennial; usually caespitose, sometimes rhizomatous. Culms 20–310 cm tall, erect, much-branched distally. Leaves not aromatic; ligules membranous, sometimes ciliate; blades linear, flat, folded, or convolute. Inflorescences terminal and axillary or a false panicle; inflorescence units 1–600 per culm; peduncles initially concealed by the subtending sheaths, sometimes exserted beyond the sheaths at maturity, with (1)2–5(13) spikes; spikes not reflexed at maturity, axes slender, terete to flattened, not longitudinally grooved, usually conspicuously pubescent, with spikelets in heterogamous sessile-pedicellate pairs (the terminal spikelets sometimes in triplets of 1 sessile and

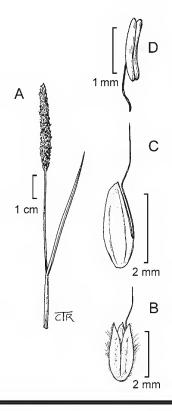

FIGURE 12. *Alopecurus geniculatus*. A. Culm and Inflorescence. B. Spikelet. C. Lemma, lateral view. D. Stamen. Drawn by Cindy Roché; copyright Utah State University.

2 pedicellate spikelets), apex of the internodes neither cupulate nor fimbriate; disarticulation in the spikes below the sessile spikelets. Sessile spikelets bisexual, awned, with short, blunt calluses; lower glumes 2-keeled, flat or concave, usually veinless between the keels, sometimes 2- to 9-veined; anthers 1 or 3(2). Pedicels usually longer than 3 mm long, similar to the rame internodes in shape, length, and pubescence color, not fused to the rame axes. Pedicellate spikelets usually vestigial or absent, sometimes well-developed and staminate. x = 10.

Andropogon is a cosmopolitan genus of tropical and temperate zones, comprising 122 species (Kellogg, 2015). The genus needs to be intensively studied since it has been found to be paraphyletic (Skendzic et al., 2007) or monophyletic (Estep et al., 2014).

KEY TO SPECIES OF ANDROPOGON

- 1. Perennial; upper glume of the sessile spikelets unawned.

14. Andropogon fastigiatus Sw., Prodr. 26. 1788. Diectomis fastigiata (Sw.) P. Beauv., Ess. Agrostogr. 132, 160. 1812.

Annual; caespitose. Culms 30–200 cm tall. Leaves generally cauline, sheaths inconspicuously carinate at the apex; ligula 5–11 mm long, glabrous, decurrent, conspicuously veined; blades 15–35 cm long, 1–3 mm wide, scabrous or puberulent, flat, apex acuminate; inflorescences numerous, partly enclosed in the sheaths, narrow, spikes 1 per peduncle, 3–5 cm long, rachis internodes claviform; sessile spikelets 4–5 mm long, callus markedly oblique, pilose, hairs 2–3 mm; lower glume deep and narrowly sulcate, membranous, veinless, pilose between keels, unawned, upper glume carinate, navicular, largely awned, awn 10–20 mm long, divergent, not twisted on the superior half, geniculate; anthers 3, 1.5–1.8 mm; pediceled spikelets 7–8 mm long, sterile; lower glume conspicuously enlarged, flattened, with awn 6–10 mm long, geniculate with a twisted column. 2n = 20.

DISTRIBUTION AND HABITAT. Andropogon fastigiatus grows in grasslands and pine forests. It is known from Mexico to South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Parque Nacional Barranca del Cobre, 3.2 km S of La Bufa on road to Batopilas, tropical forest, 1050 m, P.M. Peterson, Annable & Valdés-Reyna 10860 (CIIDIR, US); Parque Nacional Barranca del Cobre, 6.7 km NE of Batopilas along the Río Batopilas at the Arroyo de Santiago, 690 m, P.M. 15. Andropogon gerardii Vitman, Summa Pl. 6: 16. 1792.

FIGURE 13

Plants often forming large clumps; rhizomes, if present, with internodes shorter than 2 cm. Culms 1–3 m tall, often glaucous. Sheaths glabrous or pilose; ligules 0.4–2.5 mm; blades 5–50 cm long, (2)5–10 mm wide, usually pilose adaxially, at least near the collar. Inflorescence units usually only terminal; peduncles with 2–6(10) spikes; spikes 5–11 cm long, exserted at maturity, usually purplish, sometimes yellowish; internodes sparsely to densely pubescent, hairs 2.2–4.2 mm long, usually white, rarely yellowish. Sessile spikelets 5–11 mm long, scabrous; awns 8–25 mm; anthers 3, 2.5–4.5 mm. Pedicellate spikelets 3.5–12 mm long, usually well-developed and staminate. 2n = 20, 40, 60 (usually), 70, 80, 90.

DISTRIBUTION AND HABITAT. Andropogon gerardii grows in prairies, meadows, and generally dry soils. It is a widespread species, extending from southern Canada to Mexico

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: km 2064 carr [hwy] Chih.-V.  Andropogon glomeratus (Walter) Britton, Sterns & Poggenb., Prelim, Cat. 67, 1888.

FIGURE 14

Plants caespitose, upper portion dense, oblong to oblanceolate or obpyramidal. Culms 20–250 cm; internodes green, sometimes glaucous; branches mostly erect, straight. Sheaths usually scabrous, sometimes smooth; ligules 0.6–2.2 mm long, sometimes ciliate, cilia to 0.9 mm; blades 13–109 cm long, 2.9–9.5 mm wide, glabrous or sparsely to densely pubescent, hairs usually spreading, rarely appressed. Inflorescence units 10–600 per culm; subtending sheaths (2.0)2.9–4.4(6.5) cm long, (1.5)2.3–3.4(4.4) mm wide; peduncles (1)6–14(60) mm long, with 2(4) spikes; spikes (1)1.7–2.5(3.5) cm

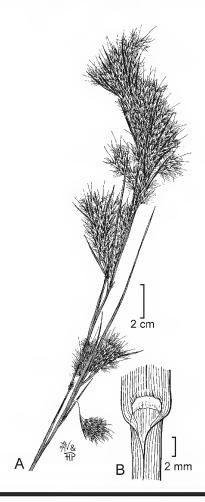

FIGURE 14. Andropogon glomeratus. A. Inflorescence. B. Ligule. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

long, exserted or not at maturity, pubescence sparse basally and increasing in density distally within each internode. Sessile spikelets 3–5 mm; callus hairs 1–2.5 mm; keels of lower glumes sometimes scabrous below midlength, usually scabrous distally; awns 6–19 mm; anthers 1(3), 0.5–1.5 mm long, yellow, red, or purple. Pedicellate spikelets vestigial or absent, sterile. 2n = 20.

DISTRIBUTION AND HABITAT. This species has five varieties; only *Andropogon glomeratus* var. *pumilus* (Vasey) Vasey occurs in Chihuahua. It is weedy and grows in disturbed wet or moist sites. It is abundant and widespread, extending from the southern United States through Central America to northern South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Rio Bonito hot country, 26 Aug 1936, *H. LeSueur 0100* (US). Galeana: Cerro Angostura Springs, 2.4 mi, by Mexico Highway 10, N of Angostura, 8 Oct 1982, *F.W. Reichenbacher 1310* (ARIZ).

Anthoxanthum L.

Annual or perennial; densely to loosely caespitose, sometimes rhizomatous; fragrant. Culms 4-100 cm tall, erect or geniculate, sometimes branched; internodes hollow. Leaves cauline or basally concentrated, glabrous or softly hairy; sheaths open, auricles absent or present; ligules membranous, sometimes shortly ciliate or somewhat erose; blades flat or rolled, glabrous or sparsely hairy. Inflorescences open or contracted panicles, sometimes spikelike. Spikelets pedicellate or sessile, 2.5-10 mm long, laterally compressed, stramineous to brown at maturity, with 3(4) florets, lowest 2 florets usually staminate or sterile, sometimes reduced to dorsally compressed lemmas, subequal to or exceeding the distal floret, distal floret bisexual; rachilla not prolonged beyond the base of the distal floret; disarticulation above the glumes, the florets falling together. Glumes unequal or subequal, equaling or exceeding the florets, lanceolate to ovate, glabrous or pilose, keeled; calluses blunt, glabrous or hairy; lowest 2 florets: lemmas strongly compressed, 3-veined, strigose, hairs brown, apex bilobed, unawned or dorsally awned; distal florets: lemmas somewhat indurate, glabrous or with hairs, shiny, inconspicuously 3- to 7-veined, unawned; paleas 1-veined, enclosed by the lemmas; lodicules 2 or absent; anthers 2 or 3. Caryopses shorter than the lemma, concealed at maturity, tightly enclosed in the floret; hila less than $\frac{1}{3}$ the length of the caryopses, oval. x = 5.

Anthoxanthum is a cool-season genus of about 50 species that grow in cool-temperate and arctic regions throughout the world. There are seven species in North America, five of which are native, and only one introduced in Chihuahua (Allred & Barkworth, 2007).

17. Anthoxanthum odoratum* L., Sp. Pl. 28. 1753.

FIGURE 15

Plants perennial. Culms (10)25–60 (100) cm tall, erect, simple or sparingly branched. Auricles 0.5–1 mm long, pilose-ciliate, sometimes absent; ligules 2–7 mm long, truncate; blades 1–31 cm

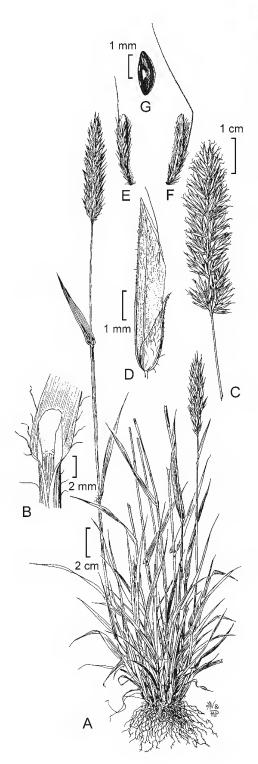

FIGURE 15. Anthoxanthum odoratum. A. Habit. B. Ligule. C. Inflorescence. D. Spikelet. E. Sterile floret. F. Sterile floret. G. Fertile floret. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

long, 3–10 mm wide. Panicles (3)4–14 cm long, the spikelets congested; lowermost branches 10–25 mm; pedicels 0.5–1 mm long, pubescent. Spikelets 6–10 mm; lower glumes 3–4 mm long, upper glumes 8–10 mm; 2 lowest florets sterile, 34 mm long, awn of the first lemma 2–4 mm long, awn of the second lemma 4–9 mm long, equaling or only slightly exceeding the upper glumes; bisexual florets 1–2.5 mm; anthers 2, (2.9)3.5–4.8(5.5) mm. 2n = 10, 20.

DISTRIBUTION AND HABITAT. Anthoxanthum odoratum is native to southern Europe. In North America, it grows in meadows, pastures, grassy beaches, old hay fields, wasteplaces, and openings in coniferous forests (occasionally in dense shade) or as a weed in lawns. It is known from North America in Canada, the United States, and Mexico in Chiapas, Chihuahua, Coahuila, Distrito Federal, Durango, Hidalgo, México, and Oaxaca and in Central America, South America, and the Caribbean.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Herrera Arrieta and Cortés Ortiz (2010).

Aristida L.

Plants usually perennial; herbaceous, usually caespitose, occasionally rhizomatous. Culms 10-150 cm long, not woody, sometimes branched above the base; internodes usually pithfilled, sometimes hollow. Leaves sometimes predominantly basal, sometimes predominantly cauline; sheaths open; auricles lacking; ligules of hairs or very shortly membranous and long-ciliate, the 2 types generally indistinguishable. Inflorescences terminal, usually panicles, sometimes racemes, occasionally spikes; primary branches without axillary pulvini and usually appressed to ascending, or with axillary pulvini and ascending to strongly divergent or divaricate. Spikelets with 1 floret; rachillas not prolonged beyond the florets; disarticulation above the glumes. Glumes often longer than the florets, thin, usually 1- to 3-veined, acute to acuminate; florets terete or weakly laterally compressed; calluses well-developed, hirsute; lemmas fusiform, 3-veined, convolute, usually glabrous or scaberulous, usually enclosing the palea at maturity, usually with 3 terminal awns, lateral awns reduced or obsolete in some species, lemma apex sometimes narrowed to a straight or twisted beak below the awns; awns ascending to spreading, usually straight, bases sometimes twisted together into a column or the bases of the individual awns coiled, twisted, or otherwise contorted, occasionally disarticulating at maturity; paleas shorter than the lemmas, 2-veined, occasionally absent; anthers 1 or 3. Caryopsis fusiform. x = 11, 12.

Aristida is a tropical to warm-temperate genus of 304 species (Kellogg, 2015).

KEY TO SPECIES OF ARISTIDA

1. Lateral awns of the lemma markedly reduced, generally less than 1/3 as long as the central awn.	
2. Sheaths collar densely pilose, with hairs conspicuously cobwebby and tangled, often deflexed at maturity	
A. gypsophila	t
2. Sheaths collar with hairs straight or somehow tangled, but not conspicuously cobwebby, generally extended.	
3. Lemma narrowing to slightly keeled, usually with an untwisted beak	ŝ
3. Lemma terminating in a twisted, awn-like beak 4–6.5 mm long.	
 4. Panicles open, all the primary branches with axillary pulvini; branches naked at the base A. schiedeana 4. Panicles closed, contracted, none of the primary branches (except occasionally the inferior ones) with axillary pulvini, then branches tightly appressed to the main axis. 	7
5. Lemmas 18–22(25) mm long; panicle sparsely flowered; spikelets 3–12 in total, 2(4) per branch	
5. Lemmas smaller, 10–13 mm long; panicle densely flowered, more than 16 spikelets per branch A. eludens 1. Lateral awns of the lemma well-developed, at least ½ as long as the central awn.	
6. Lemma involute, sulcate	ı
6. Lemma convolute, never sulcate.	
7. Lemma beak lacking or sparsely developed; annual.	
8. Lower glumes shorter than upper ones; lateral awns equal to central awn	3
8. Glumes equal sized; lateral awns shorter than central awn	
7. Lemma beak well-developed, the twisted part 1–9 mm long, sometimes straight; perennial.	
9. Glumes markedly unequal in size, the lower less than ¾ as long as the upper; beak less than 2 mm long, or missing.	
10. Lemma 7–12 mm long, awns subequal, (7)10–25 mm long	
10. Lemma 10–15 mm long, awns equal, 20–56(65) mm long	
9. Glumes equal to subequal in size, the lower at least ¾ as long as the upper; beak twisted (occasionally straight in	1
A. havardii), 2–9 mm long.	
11. Panicle usually completely open, the primary branches widely divergent with axillary pulvini.	
12. Lemma beak twisted 5–9 mm long; lemma 10–12 mm long; central awn 10–20 mm long, lateral awns	
3–7 mm long	
12. Lemma beak twisted 0.5–4 mm long; lemma 7–9 mm long; central awn 8–20 mm long, lateral awns almost	Ē
equal to the central.	
13. Spikelets divergent from twigs, the pedicels with axillary pulvini; primary branches 2–6 cm long;	
plants delicate, 20–40 cm tall	
13. Spikelets and twigs plicate along the primary branches, the pedicels lacking axillary pulvini; primary	
branches 5–13 cm long; plants robust, 25–75 cm tall	
axillary pulvini, but only in 1–2 proximal branches.	,
14. Lemma 7.5–9 mm long, the awns unequal, the central one 16–35 mm long, the lateral ones 13–25 mm	,
long; inflorescence densely flowered, the florets overlapping	
14. Lemma 10–14 mm long, equal awns, 15–20 mm long; inflorescence loosely flowered, the florets not over-	
lapping	

18. Aristida adscensionis L., Sp. Pl. 1: 82. 1753.

FIGURE 16

Plants short- to long-lived annuals. Culms (3)10–50(80) cm tall, often highly branched above the base. Leaves cauline, glabrous; sheaths shorter than the internodes, not disintegrating into threadlike fibers; ligules 0.4–1 mm long; blades 2–14 cm long, 1–2.5 mm wide, flat to involute. Inflorescences panicles, 5–15(20) cm long, 0.5–3 cm wide, often interrupted below; nodes glabrous or with straight, less than 0.5 mm hairs; primary branches 1–4 cm long, erect to ascending, without axillary pulvini, with 3–8 spikelets. Spikelets crowded. Glumes unequal,

1-veined, acuminate; lower glumes 4–8 mm; upper glumes 6–11 mm long; calluses 0.5–0.8 mm long; lemmas 6–9 mm long, slightly keeled, midveins scabrous, junction with the awns not evident; awns not disarticulating at maturity, flattened and straight to somewhat curved at base, central rib flanked by equally wide pale wings; central awns 7–15(20) mm long; lateral awns somewhat shorter, occasionally only 1–2 mm long; anthers 3, 0.3–0.7 mm long. 2n = 22.

DISTRIBUTION AND HABITAT. Aristida adscensionis grows in waste ground, along roadsides, and on degraded rangelands and dry hillsides, often in sandy soils. It is associated with woodland, prairie, and desert shrub communities. Its range

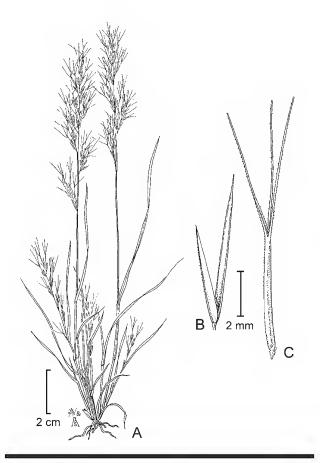

FIGURE 16. Aristida adscensionis. A. Habit. B. Glumes. C. Lemma. Drawn by Linda Ann Vorobik and Andy Sudkamp; copyright Utah State University.

extends from the United States south through Mexico and Central America to South America.

Aristida appressa Vasey, Contr. U.S. Natl. Herb. 1(8): 282. 1893.

Perennial; mat-forming. Culms 30–105 cm tall, erect, simple, slightly branched from the proximal nodes, glabrous. Leaves basal and cauline, straight or curved, not spirally inrolled with age; sheaths glabrous; blades 10–35 cm long, 1–3 mm wide, flat or plicate, puberulent and frequently with long hairs sparse adaxially, near the base. Panicle 10–25(30) cm long, narrow, densely flowered, the spikelets overlapping, erect, sometimes inclinate; branches 5–10 cm long, appressed, scabrous, with spikelets to the base, appressed or occasionally open. Spikelets appressed; glumes acute or short-awned, the awn 1–2 mm long, 1-veined, lower glumes (7)9–11 mm long, upper glumes 9–13 mm long, a little longer than the lower; lemmas 7.5–9 mm long, convolute, scabrous toward the apex, lemma beak 2–4 mm long, twisted, not articulate, awns 3, straight to divergent, the central 16–35 mm long, the lateral 13–25 mm long; anthers 1.3–2.3 mm long.

DISTRIBUTION AND HABITAT. Aristida appressa grows in grasslands in oak and desert shrub communities. Its range extends from Mexico to Central America.

20. Aristida arizonica Vasey, Bull. Torrey Bot. Club 13(2): 27. 1886.

FIGURE 17

Perennial; usually caespitose, occasionally with rhizomes. Culms 30-80(100) cm long, erect, unbranched. Leaves mostly basal; sheaths usually longer than the internodes, mostly glabrous, throat sometimes with hairs, not disintegrating into threadlike fibers; collars glabrous or with hairs at the sides; ligules 0.2-0.4 mm long; blades 10-25(30) cm long, 1-3 mm wide, usually flat, often curling like wood shavings when mature, glabrous. Inflorescences spikelike panicles, 10-25 cm long, 1-3 cm wide, loosely flowered, the spikelets not overlapping; nodes glabrous or with straight, about 0.5 mm, hairs; primary branches 2-6 cm long, appressed, without axillary pulvini, with 2–8 spikelets. Glumes 10–15(18) mm long, brownish, acuminate to awned, awns to 3 mm; lower glumes slightly shorter than to equaling the upper glumes, 1- to 2-veined; calluses 1-1.8 mm; lemmas 12-18 mm long, glabrous, rarely sparsely pilose, terminating in a 3-6 mm twisted column, junction with the awns not conspicuous; awns 20-35 mm long, straight to curved basally, ascending distally, not disarticulating at maturity; central awns 20-35 mm; lateral awns slightly shorter than the central awns; anthers 3, 1.3–1.9 mm long. 2n = 22.

DISTRIBUTION AND HABITAT. Aristida arizonica grows in pine, pine-oak, and pinyon-juniper woodlands from the southwestern United States to southern Mexico. It may be confused with A. purpurea var. nealleyi but differs in having flat, curly leaf blades and longer awns.

FIGURE 18

Perennial; caespitose. Culms 25-70 cm tall, erect or prostrate, unbranched or sparingly branched. Leaves tending to be basal; sheaths longer than the internodes, glabrous except at the summit; collars densely pilose; ligules 0.5-1 mm long; blades 5-20 cm long, 1-2 mm wide, flat to loosely involute, glabrous. Inflorescences paniculate, 10-30 cm long, 6-25 cm wide, peduncles flattened and easily broken; rachis nodes glabrous or with hairs, hairs to 0.5 mm; primary branches 5-13 cm long, stiffly divaricate to reflexed, with axillary pulvini, usually naked on the basal 1/2; secondary branches usually well-developed. Spikelets overlapping, usually appressed, sometimes divergent and the pedicels with axillary pulvini. Glumes 8-12 mm long, 1-veined, acuminate or shortly awned, awns to 4 mm; calluses about 0.5 mm; lemmas 8-13 mm long, the terminal 2-3 mm with 4 or more twists when mature, narrowing to 0.1-0.2 mm wide just below the awns, junction with the awns not evident; awns (7)10-20 mm long, not disarticulating at maturity; central awns almost straight to curved at the base, ascending to somewhat divergent distally; lateral awns slightly thinner and from

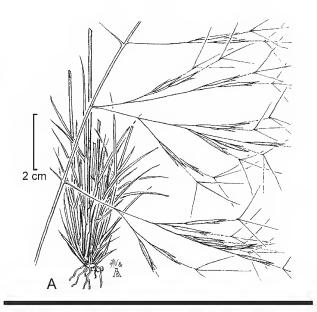

FIGURE 18. Aristida divaricata. A. Habit. Drawn by Linda Ann Vorobik and Andy Sudkamp; copyright Utah State University.

much to slightly shorter than the central awns, ascending to divergent; anthers 3, 0.8-1 mm long. Caryopsis 8-10 mm long, light brown. 2n = 22.

DISTRIBUTION AND HABITAT. Aristida divaricata grows on dry hills and plains, especially in pinyon-juniper-grassland zones, from the southwestern United States through Mexico to Guatemala. It occasionally intergrades with A. havardii, but that species has lemma beaks that are straight or have only 1–2 twists, shorter primary branches, usually no secondary branches, and pedicels that more frequently have axillary pulvini so the spikelets are more frequently divergent than in A. divaricata.

Specimens MEXICO. Chihuahua. Examined. Ahumada: 5 km al N de Flores Magón, 30 Jul 1994, 1200 m, R. Corral, E. Pérez, A. Domínguez & F. 22. Aristida eludens Allred & Valdés-Reyna, Novon 5: 209–222. 1995.

Perennial; mat-forming. Culms 35-65(80) cm tall, erect, branched from the base, glabrous. Sheaths glabrous or scaberulous, rounded, collar with a lock of hairs at the edges, occasionally with a row of small hairs dorsally crossing; ligule 0.2-0.3 mm long, a ring of hairs; blades 12–35 cm long, 1–1.5 mm wide, flat or partially plicate when young, inrolled when mature, glabrous or scaberulous. Panicle 10-22 cm long, 1-2 cm wide, with more than 16 spikelets, narrow, contracted, nodes glabrous; branches 5-9 cm long, divaricate, erect, appressed to the main axis, spikelets from the base. Spikelets appressed, occasionally present in the inferior axils. Glumes glabrous, brown, subequal, 1-veined, 8-13 mm long, the apex acute and often with a mucro; lemma 10-13 mm long, glabrous, mottled, awn beak 3-5 mm long, twisted, central awn 5-10 mm long, geniculate, not twisted, lateral awns highly reduced, erect, 0.1-3 mm long, callus 0.5-1 mm long, with stiff hairs to 1 mm; paleas completely enclosed by the lemma, hyaline; anthers 0.8-1 mm long. Caryopses 6-8 mm long, fusiform, brown.

DISTRIBUTION AND HABITAT. Aristida eludens grows on grasslands over calcareous soils. It is known from Mexico in Chihuahua, Coahuila, Durango, Guanajuato, Nuevo León, Oaxaca, Querétaro, and San Luis Potosí.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Yamuco at 1 km E of Hwy towards Basihuare and Creel, N of Rio Urique crossing, 26 Aug 2003, bosque de pino [pine forest], 1891 m, *P.M. Peterson & P. Catalán* 17536 (US).

23. Aristida gibbosa (Nees) Kunth, Enum. Pl. 1: 189. 1833. Chaetaria gibbosa Nees, Fl. Bras. Enum. Pl. 2: 383. 1829.

Perennial; caespitose. Culms 50–95 cm tall, erect, simple, glabrous. Basal leaves markedly spirally inrolled when mature, cauline generally straight or curved; sheaths glabrous; blades 15–25 cm long, 1–2 mm wide, flat, plicate near the apex, glabrous abaxially, densely puberulent occasionally with spaced hairs adaxially. Panicle 10–30 cm long, narrow but somewhat open, branches ascending, scabrous, with spikelets from the base,

pedicels ascending. Glumes 1-veined, the lower 7.5–9.5 mm long, scabrous on the keel, shortly awned, the upper 7–8 mm long, glabrous, acuminate; lemma 6–7.6 mm long, involute, conspicuously sulcate, glabrous, awn beak 1–4 mm long, twisted, not articulate, awns 3, erect to divergent, the central 9–14 mm long, the lateral 6–12 mm long; callus 0.2–0.4 mm long, obtuse, pillose, the hairs 0.5–0.7 mm long; anthers 1.6–2.3 mm long.

DISTRIBUTION AND HABITAT. Aristida gibbosa ranges from Mexico to Central America, South America, and the Caribbean.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: 24.6 km W of Guachochi and 0.6 km S of Rocheachi, 2340 m, *P.M. Peterson, Annable & Valdés-Reyna* 10793 (US). Uruachi: Guazaremos, Río Mayo, 26 Sep 1935, *Gentry* 1873 (US).

24. Aristida gypsophila Beetle, Phytologia 49(1): 36–37. 1981.

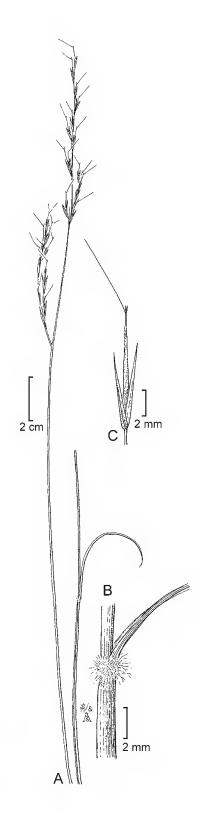

FIGURE 19

Perennial. Culms 45-80 cm tall, erect, usually unbranched. Leaves basal and cauline; sheaths longer than the internodes, glabrous except at the summit; collars densely pilose, hairs 1-3 mm long, cobwebby and tangled, often deflexed; ligules less than 0.5 mm long; blades 5-15 cm long, about 0.5 mm wide, usually involute, occasionally loosely folded, glabrous, light green. Inflorescences paniculate, 12-20 cm long, 2-8 cm wide; primary branches 2-5 cm long, erect to horizontal, with or without axillary pulvini, with 1-5 spikelets. Spikelets appressed or with axillary pulvini and spreading. Glumes 6–10(12) mm long, equal or the lower glumes slightly shorter, 1-veined, brownish; calluses about 0.5 mm; lemmas (6)7-14(16) mm long, mostly smooth, mottled, terminating in a 2-4 mm long, usually twisted, scabrous beak; central awns 5-10 mm long, sharply curved at the base, spreading distally; lateral awns absent or to 3 mm long, erect; anthers 3, about 1.5 mm long, brown. Caryopsis 5-8 mm long.

DISTRIBUTION AND HABITAT. Aristida gypsophila grows on rocky limestone or gypsum hills in thorn scrub communities of the Chihuahuan Desert, almost always growing in the protection of shrubs. It is very similar to *A. pansa*, which differs in having 3 well-developed awns and being, usually, shorter in stature. Both species have involute blades with a characteristic tuft of cobwebby hairs at the collar.

There exist three recognized forms of this species, and two are present in Chihuahua.

FIGURE 19. Aristida gypsophila. A. Culm and inflorescence. B. Sheath, collar, and blade. C. Spikelet. Drawn by Linda Ann Vorobik and Andy Sudkamp; copyright Utah State University.

KEY TO FORMS OF ARISTIDA GYPSOPHILA

- 1. Axillary pulvini present; panicle branches extended, at least the primary ones A. gypsophila fo. gypsophiloides

Aristida gypsophila fo. diffussa Allred & Valdés-Reyna, Brittonia 49(1): 65. 1997.

Known only from Mexico (Chihuahua, San Luis Potosí).

Specimens Examined. MEXICO. Chihuahua. Jiménez: Sierra Las Pampas, N end of the sierra along dirt rd from Las Pampas to jct with rd to Camargo, 23 Sep 1992, matorral xerófilo [xerophilous scrub], 1400 m, *Allred & Valdés-Reyna 5815* (NMC).

Aristida gypsophila fo. gypsophiloides Allred & Valdés-Reyna, Brittonia 49(1): 65, 1997.

Known from the Unites States to Mexico in Chihuahua, Coahuila, and San Luis Potosí.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Jiménez: Sierra Las Pampas, N end of the sierra, from Las Pampas to Camargo, 6.2 mi SE of jct, 23 Sep 1992, matorral xerófilo [xerophilous scrub], 1370 m, *Allred & Valdés-Reyna 5804* (NMC) Holotipo; Sierra Las Pampas, N end of the sierra along dirt rd from Las Pampas to jct with rd to Camargo, 23 Sep 1992, matorral xerófilo, 1400 m, *Allred & Valdés-Reyna 5810, 5812* (NMC); N end of Sierra Las Pampas, 11.5 km NW of Las Pampas on rd to Camargo, 24 Aug 1972, *Chiang & A. Lott 8805* (MEXU).

25. Aristida bavardii Vasey, Bull. Torrey Bot. Club 13(2): 27,1886.

FIGURE 20

Perennial; caespitose. Culms 15-40 cm tall, slender, usually erect, occasionally decumbent, often tightly clustered into hemispheric clumps, unbranched. Leaves mostly basal; sheaths longer than the internodes, glabrous except at the summit; collars densely pilose; ligules 0.5–1 mm long; blades 5–20 cm long, 1-2 mm wide, flat to loosely involute, glabrous. Inflorescences paniculate, 8-18 cm long, 4-12 cm wide, peduncles often flattened and easily broken; rachis nodes glabrous or with straight, less than 0.3 mm, hairs; primary branches 2-6 cm long, stiffly divaricate to reflexed, with axillary pulvini, usually naked on the lower 1/2; secondary branches usually absent. Spikelets usually divergent, pedicels usually with axillary pulvini. Glumes 8-12 mm long, 1-veined, acuminate or awned, awns to 4 mm long; calluses about 0.5 mm long; lemmas 8-13 mm long, glabrous, smooth or scabrous, terminal 2-3 mm straight or with 1-2 twists, narrowing to 0.1–0.2 mm wide, junction with the awns not evident; awns (7)10-22 mm long, not disarticulating at maturity, from almost straight to somewhat curved basally, ascending to divergent distally; lateral awns slightly shorter and thinner than the central awns; anthers 3, 0.8-1 mm long. Caryopsis 8-10 mm long, light brown. 2n = 22.

DISTRIBUTION AND HABITAT. Aristida havardii grows on dry hills and plains in desert grassland to pinyon—juniper zones, and in sandy to rocky ground, from the southwestern United States to northern Mexico. It occasionally intergrades with A. divaricata, but that species differs in having more twisted lemma beaks, longer primary branches, well-developed secondary branches, and, usually, appressed spikelets.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: 1 km al Pte Sueco; carr. [hwy] Sueco–Buenaventura,

26. Aristida laxa Cav., Icon. 5: 44–45, t. 470, f. 1. 1799.

Perennial; with strong roots. Culms 40-60(100) cm tall, erect, simple. Leaves basal and cauline, persistent and spirally twisted with age; sheaths glabrous; blades 1-30 cm long, 2-2.5 mm wide, flat toward the base, involute toward the apex, glabrous abaxially, with long hairs adaxially. Panicles 20-35 cm long, pyramidal, open, branches long, spreading to inclinate, scabrous, branched below the half, naked at the base; pedicels appressed. Spikelets 2.3-2.6 mm including the awns. Glumes subequal, 1-veined, the lower 9-12 mm long, scabrous, narrow-apiculate, brown, the upper 10-12 mm long, glabrous; lemma 10-12 mm long, convolute, glabrous, apiculate, beak awn 5-9 mm long, twisted, not articulate, awns 3, straight, the central 10-20 mm long, the laterals 3-7 mm long; anthers 1.2-1.6 mm long, 2n = 44.

DISTRIBUTION AND HABITAT. Aristida laxa grows on open areas of the pine and oaks forests. It is known from Mexico. There are three varieties of this species; in Mexico, Aristida laxa var. laxa is found.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Namiquipa: at Rancho Teseachic, Mar 1974, rocky hills, *A.A. Beetle M-3274* (MEXU). Guachochi: 21.8 km al SW de la desviación a [deviation to] La Bufa, 22 km al S de Humira, 17 Sep 1983, bosque de pino–encino [pine–oak forest], 2070 m, *R. Torres et al.* 3675 (MEXU).

27. Aristida longespica Poir., Encycl. Suppl. 1: 452. 1810.

FIGURE 21

Annual. Culms 15–65 cm long, erect to spreading, often geniculate-based, sometimes nearly prostrate, usually muchbranched. Leaves cauline; sheaths shorter than the internodes,

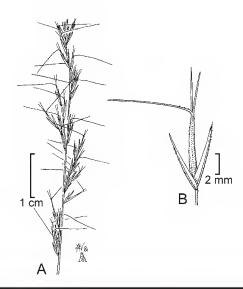

FIGURE 21. Aristida longespica. A. Inflorescence. B. Spikelet. Drawn by Linda Ann Vorobik and Andy Sudkamp; copyright Utah State University.

not disintegrating into threadlike fibers at maturity, glabrous or sparsely pilose, hairs on the throat sometimes to 5 mm; collars glabrous; ligules about 0.5 mm long; blades 5-14 cm long, 1-2 mm wide, flat to loosely involute, light green. Inflorescences usually paniculate, occasionally racemose or spicate, 6-22 cm long, 1-4(6) cm wide; nodes glabrous or with straight hairs, hairs to 0.3 mm; primary branches 1-4 cm long, appressed to erect, rarely somewhat spreading distally, without axillary pulvini, with 2-5 spikelets per branch. Spikelets widely spaced to crowded. Glumes subequal, 2-11 mm long, 1-veined, acuminate, unawned or awned, awns to 1 mm; calluses less than 1 mm; lemmas 2.5–10 mm long, gray to dark purplish-brown, often horizontally banded or mottled, scabrous-hirsute or glabrous, not beaked, apex only slightly narrowed, junction with the awns not evident; awns usually unequal, terete and curving up to 100° at the base, erect to reflexed distally, not disarticulating at maturity; central awns 1-27 mm; lateral awns absent or to 18 mm long, shorter than the central awns; anthers 1 and 0.2–0.3 mm long, or 3 and 3-4 mm long. Caryopsis 3-4 mm long, light brown.

DISTRIBUTION AND HABITAT. Aristida longespica grows along roadsides and in waste places, sandy fields, and clearings in pine and oak woods of southern Ontario and the eastern and central United States to Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chinipas: Sierra Saguarivo, 1.3 mi W of Curahui, 9 Sep 2008, tropical deciduous forest, 1001 m, *P.M. Peterson & J.M. Saarela* 22150 (US); 2.1 mi W of Curahui on road towards Saguarivo, 1328 m, open woods with pines and oaks, 9 Sep 2008, *P.M. Peterson & J.M. Saarela* 22158 (US).

28. Aristida pansa Wooton & Standl., Contr. U.S. Natl. Herb. 16: 112. 1913.

FIGURE 22

Perennial; caespitose. Culms 20-60(75) cm tall, erect, unbranched. Leaves basal and cauline; sheaths usually longer than the internodes, glabrous except at the summit; collars densely pilose, hairs 1-3 mm long, cobwebby and tangled, often deflexed; ligules less than 0.5 mm long; blades 4-28 cm long, less than 1 mm wide, usually involute, infrequently flat, usually arcuate, abaxial surfaces glabrous, adaxial surfaces glabrous or puberulent near the base, scabrous or puberulent distally. Inflorescences paniculate, 10-20 cm long, 3-10(12) cm wide; rachis nodes usually glabrous, sometimes with straight, less than 0.3 mm, hairs; primary branches 2-11 cm long, stiffly ascending to spreading, with axillary pulvini; secondary branches and pedicels with or without pulvini; terminal spikelets often divergent. Spikelets clustered on the distal ½ of the branches. Glumes equal or subequal, 1-veined, acuminate or awned, awns to 6 mm long, brownish; lower glumes 5-10 mm; upper glumes 6-12 mm; calluses 0.5-1 mm; lemmas 7-13 mm long, terminating in an obscure, narrow beak 1-4 mm long, 0.1-0.2 mm wide, junction with the base of the awns not evident; awns 6-15 mm long, not disarticulating at maturity, central and lateral awns similar in length and thickness, spreading to horizontal; anthers 3, 1–3 mm long, brown. Caryopsis 6-8 mm long, tan.

DISTRIBUTION AND HABITAT. Aristida pansa grows in desert scrub, commonly in the Chihuahuan Desert of the southwestern United States and Mexico, but its ecological range extends into the lower juniper zones and its geographic range to southern Mexico. It has been confused with A. purpurea var. perplexa, which differs in having reddish glumes of unequal length and longer ascending awns.

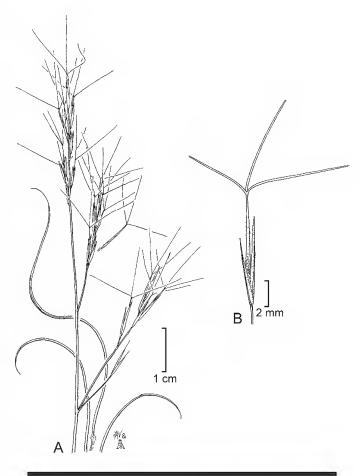

FIGURE 22. Aristida pansa. A. Habit. B. Spikelet. Drawn by Linda Ann Vorobik and Andy Sudkamp; copyright Utah State University.

29. Aristida purpurea Nutt., Trans. Amer. Philos. Soc., n.s., 5: 145. 1837.

Perennial; densely caespitose, without rhizomes. Culms 10–100 cm long, erect to ascending, usually unbranched. Leaves mostly basal or mostly cauline; sheaths shorter or longer than the internodes, glabrous, not disintegrating into threadlike fibers

at maturity; collars glabrous, or sparsely pilose at the sides with straight hairs; ligules less than 0.5 mm long; blades 4-25 cm long, 1-1.5 mm wide, tightly involute to flat, usually glabrous, sometimes scaberulous abaxially, gray-green, lax to curled at maturity. Inflorescences usually sparingly branched panicles, occasionally racemes, 3-30 cm long, 2-12 cm wide, with 2 or more spikelets per node; nodes glabrous or with straight, about 0.5 mm, hairs; primary branches 3-6 cm long, appressed to divaricate, varying sometimes within a panicle, stiff to flexible, bases appressed or abruptly spreading, usually without axillary pulvini. Spikelets divergent or appressed, with or without axillary pulvini. Glumes usually unequal, sometimes subequal, light to dark brown or purplish, glabrous, smooth or scaberulous, 1(2)-veined, acuminate, unawned or awned, awns to 1 mm; lower glumes 4–12 mm; upper glumes 7–25 mm; calluses 0.5–1.8 mm; lemmas 6-16 mm long, glabrous, scaberulous, or tuberculate, whitish to purplish, apex 0.1-0.8 mm wide, not beaked or the beak less than 3 mm long, junction with the awns not conspicuous; awns (8)13-140 mm long, ascending to divaricate, not disarticulating at maturity; central awns thicker than the lateral awns; lateral awns (8)13-140 mm long, usually subequal to the central awns, occasionally less than 1/3 as long as the central awns; anthers 3, 0.7-2 mm long. Caryopsis 6-14 mm long. 2n = 22, 44, 66, 88.

Aristida purpurea is composed of several intergrading varieties.

KEY TO VARIETIES OF ARISTIDA PURPUREA

- 1. Primary panicle branches appressed or ascending at the base, sometimes drooping distally, without axillary pulvini; awns 0.8–14.0 cm long.
 - 2. Awns 3.5–10 cm long.
 - 2. Awns 0.8-3.5 cm long.
 - 4. Summit of lemma mostly less than 0.2 mm wide, often with a prominent narrowed beak; awns delicate, mostly less than 0.2 mm wide at the base.
 - 5. Panicle branches and pedicels erect, stiff, occasionally spreading A. purpurea var. nealleyi
 - 5. Panicle branches and pedicels drooping to flexuous in an S or U shape A. purpurea var. purpurea
 - 4. Summit of lemma mostly wider than 0.2 mm long, usually without a beak or the beak indefinite; awns stout, mostly 0.2 mm or more wide at the base.
 - 6. Mature panicle branches and pedicels flexible, lax or drooping distally A. purpurea var. purpurea
 - 6. Mature panicle branches and pedicels usually stiff, straight.
 - 7. Panicles usually 15–30 cm long; blades 10–25 cm long, generally cauline A. purpurea var. wrightii

Aristida schiedeana Trin. & Rupr., Sp. Gram. Stipac. 120– 121. 1842.

Perennial; caespitose. Culms 30–120 cm tall, erect, unbranched. Leaves basal and cauline, pale green, sometimes glaucous; sheaths longer or shorter than the internodes, glabrous except at the summit; collars densely to sparsely pilose or glabrous; ligules less than 0.5 mm long; blades 8–30 cm long, 1–2 mm wide, usually flat, often curled at maturity. Inflorescences paniculate, 10–30 cm long, (4)8–26 cm wide; rachis nodes with straight hairs, hairs to 0.8 mm long; primary branches 6–16 cm long, abruptly spreading to divaricate, stiff to lax, with axillary

pulvini, usually not spikelet-bearing below midlength. Spikelets appressed, rarely spreading. Glumes 1(3)-veined, brown or purple at maturity, acuminate; lower glumes 6–13 mm; upper glumes equaling or to 4 mm shorter than the lower glumes; calluses 0.8-1.2 mm long; lemmas 10-15(17) mm long, terminating in a strongly twisted, 2–4 mm awn-like beak, junction with the awns not conspicuous; awns not disarticulating at maturity; central awns 5-12 mm long, markedly bent near the base; lateral awns absent or to 1(3) mm long, erect; anthers 1.2-2.2 mm long, brownish. Caryopsis 6-8 mm long. 2n = 22, 44.

DISTRIBUTION AND HABITAT. Aristida schiedeana grows on rocky slopes and plains, generally in pinyon–juniper, oak, or ponderosa pine communities. It has two recognized varieties in Mexico; only the *A. schiedeana* var. orcuttiana is found in Chihuahua.

31. *Aristida spanospicula* Allred, Valdés-Reyna & Sánchez-Ken, Novon 5: 209–222. 1995.

Perennial; mat-forming. Culms 25–50(66) cm tall, ascending, slender, not branched above the base, glabrous. Sheaths glabrous or sparsely pilose, ligula 0.5 mm long, a ring of hairs; blades 14–25 cm long, 1.5–2 mm wide, flat to plicate, inrolled when mature, glabrous to puberulent, green pale, the margins hardened. Panicles 10–22 cm long, 1–2 cm wide, with spaced spikelets, 3–12 in total, 2(4) on each branch, widely spaced, with capillary pedicels. Glumes 9–15 mm long, subequal, brown, 1-veined, glabrous; lemma 18–22(25) mm long, convolutes, glabrous, awns 1–3, the central 10–20 mm long, the laterals when present no longer than 0.5 mm; callus 0.6–0.8 mm long, obtuse; stamens 1.7–2 mm long, brown.

DISTRIBUTION AND HABITAT. Aristida spanospicula grows in pine-oak forests and occurs in Mexico in Chihuahua, Durango, and Sonora.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Yamuco, 1 mi E of hwy N of Rio Urique crossing, towards Basihuare and Creel, 6 Sep 2008, slopes with pines and oaks, 1890 m, *P.M. Peterson & J.M. Saarela 22075* (US); bajada [descent] a Batopilas, 25 sep 1981, bosque esclero-caducifolio

32. Aristida ternipes Cav., Icon. 5: 46. 1799.

Perennial; caespitose. Culms 25-120 cm tall, wiry, erect to sprawling, unbranched. Leaves basal and cauline; sheaths usually longer than the internodes, glabrous; collars glabrous or strigillose; ligules less than 0.5 mm; blades 5-40 cm long, 1-2.5 mm wide, flat to folded, straight to lax at maturity, adaxial surfaces with scattered 1.5-3 mm hairs near the ligule. Inflorescences paniculate, 15-40 cm long, (8)10-35(45) mm wide; rachis nodes glabrous or strigillose; primary branches 5-25 cm long, remote, stiffly ascending to divaricate, with axillary pulvini, usually naked near the base; secondary branches and pedicels usually appressed. Spikelets usually congested. Glumes subequal, 9-15 mm long, 1-veined, acuminate; calluses 1–1.2 mm; lemmas 9–15 mm long, smooth to tuberculate-scabrous, narrowing to slightly keeled, usually not twisted, 0.1-0.2 mm wide apex, junction with the awns not evident; awns unequal or almost equal, not disarticulating at maturity; central awns 8-25(30) mm long, straight to arcuate at the base; lateral awns absent or to 23 mm; anthers 3, 1.2–2.4 mm. Caryopsis 6–8 mm long, light brownish. 2n = 22, 24.

Two varieties from this species are recognized in Mexico, both in Chihuahua.

KEY TO VARIETIES OF ARISTIDA TERNIPES

- 1. Lateral awns 2–23 mm long
 A. ternipes var. gentilis

 1. Lateral awns 0–2 mm long
 A. ternipes var. ternipes
- Aristida ternipes var. gentilis (Henrard) Allred, Phytologia 77: 412. 1995. Aristida gentilis Henrard, Meded. Rijks-Herb. 54:196, 1926.
- A. hamulosa Henrard, A. ternipes var. hamulosa (Henrard) Trent.

FIGURE 30

DISTRIBUTION AND HABITAT. Aristida ternipes var. gentilis grows in grasslands and desert scrub and ranges from the United States to Mexico, Guatemala, and Honduras.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: Gallegos, 2 Oct 1958, G. Neville J. 22485 (MEXU). Aldama: 19 km N of Aldama, on the road to Coyame, 9 Jul 1972, 1300 m, F.Chiang, T. Wendt & M.C. Arundo L.

Perennial; rhizomatous, rhizomes short, usually more than 1 cm thick. Culms 2–10 m tall, 1–3.5 cm thick, usually erect, occasionally pendant from cliffs; nodes glabrous; internodes hollow. Leaves cauline, conspicuously distichous, glabrous; sheaths open, longer than the internodes; ligules membranous, shortly ciliate; blades flat or folded, margins scabrous. Panicles terminal, plumose, silvery to purplish. Spikelets laterally compressed, with 1 to several florets; rachilla internodes glabrous; disarticulation above the glumes and between the florets. Glumes longer than the florets, 3- to 5-veined; lemmas pilose, hairs not papillose-based, 3- to 7-veined, apex entire or minutely awned; paleas shorter than the lemmas, 2-veined; anthers 3. x = 12.

Arundo, a genus of three species, grows throughout the tropical and warm-temperate regions of the world. Only one species has been introduced to the Western Hemisphere.

33. Arundo donax* L., Sp. Pl. 1: 81. 1753.

FIGURE 32

Culms (2)3–10 m tall, in large tussocks or hedges. Leaves distichous; ligules 0.4–1 mm long; blades 30–100 cm long, 2–7(9) cm wide, cordate to clasping below, light to dark brown area at the base. Panicles 30–60 cm long, to 30 cm wide. Spikelets 10–15 mm long, with 2–4 florets. Glumes subequal, as long as the spikelets, thin, brownish or purplish, 3-veined, long-acuminate; lemmas 8–12 mm long, 3- to 5-veined, pilose, hairs 4–9 mm long, apex bifid, midvein ending into a delicate awn; paleas 3–5 mm long, pilose at the base; anthers 2–3 mm long. Caryopsis 3–4 mm long, oblong, light brown. 2n = 24, 100, 110.

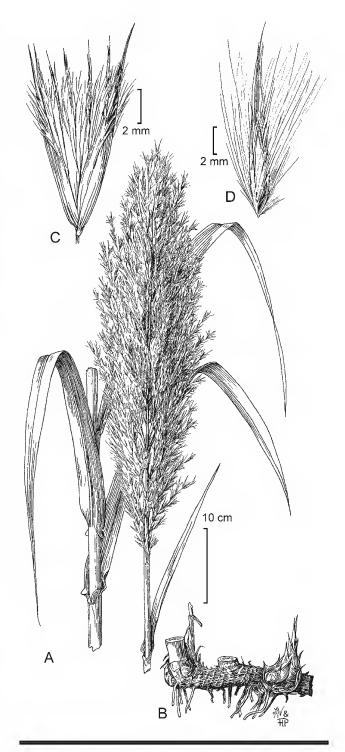

FIGURE 32. *Arundo donax*. A. Culm and inflorescence. B. Rhizome. C. Spikelet. D. Floret. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

DISTRIBUTION AND HABITAT. Arundo donax grows in the southern half of the contiguous United States and throughout Mexico, being found along ditches, culverts, and roadsides where water accumulates. It is grown for its ornamental value of tall, leafy culms and large panicles.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: 14.5 km N of Batopilas on road to La Bufa, 12 Sep 1989, 850 m, P.M. Peterson, Annable & Y. Corral & L.M. Barraza RCD6113 (UACJ). Madera: Near Chuhichupa in the Sierra Madres, 3 Sep 1899, bosque de encino [oak forest], 2240 m, C.H.T. Townsend & C.M. Barben 399 (NMC). Práxedis G. Guerrero: aprox. 3 km al NW del Porvenir, por la carr. [hwy] Juárez–Porvenir, a los lados de cultivo de algodón [near cultivated cotton], 8 Sep 1994, 1090 m, R. Corral, Bye, A. Domínguez, K. Chico & P. Yañez RCD5413 (UACJ). Uruachi: Rio Mayo between Moris and San Bernardo. 25 Sep 1991, 500 m, along the banks of the river, P. Jenkins 91-79 (ARIZ).

Avena L.

Annual or perennial. Culms 8-200 cm tall, erect or decumbent. Sheaths open; auricles absent; ligules membranous; blades usually flat, sometimes involute, lax. Inflorescences as panicles, diffuse, sometimes 1-sided. Spikelets 15-50 mm long, laterally compressed, with 1-6(8) florets; rachillas not prolonged beyond the uppermost floret; disarticulation above the glumes, usually also between the florets, or cultivated forms not disarticulating. Glumes usually exceeding the florets, membranous, glabrous, 3to 11-veined, acute; calluses rounded to pointed, with or without hairs; lemmas usually indurate and enclosing the caryopsis at maturity, 5- to 9-veined, often with twisted, strigose hairs below midlength, apex dentate to bifid or biaristate, awns (if present) dorsal, usually once-geniculate and strongly twisted in the basal portion; paleas bifid or entire, ciliate on the keels; lodicules 2, free, glabrous, toothed or not toothed; anthers 3; ovaries hairy. Caryopsis terete, ventrally grooved, pubescent. x = 7.

DISTRIBUTION AND HABITAT. *Avena*, a genus of 29 species, is native to temperate and cold regions of Europe, North Africa, and central Asia; it has become nearly cosmopolitan through the cultivation of cereal oats and the inadvertent introduction of the weedy species.

KEY TO SPECIES OF AVENA

34. Avena fatua* L., Sp. Pl. 1: 80. 1753.

FIGURE 33

Annual. Culms 8–160 cm long, prostrate to erect when young, becoming erect at maturity. Sheaths of the basal leaves with scattered hairs, distal sheaths glabrous; ligules 4–6 mm long, acute; blades 10–45 cm long, 3–15 mm wide, scaberulous. Panicles 7–40 cm long, 5–20 cm wide, nodding. Spikelets 18–32 mm long, with 2(3) florets; disarticulation beneath each floret; disarticulation scars round to ovate or triangular. Glumes subequal, 18–32 mm long, 9- to 11-veined; calluses bearded, hairs to ½ the length of the lemmas; lemmas 14–22 mm long, usually densely strigose below midlength, varying to sparsely

strigose or glabrous, veins not excurrent beyond the apex, apex usually bifid, teeth 0.3–1.5 mm long, awns 23–42 mm long, arising in the middle $\frac{1}{3}$ of the lemmas; lodicules without lobes on the wings; anthers about 3 mm long. 2n = 42.

DISTRIBUTION AND HABITAT. *Avena fatua* is native to Europe and central Asia. It is known as a weed in most temperate regions of the world; in some parts of Canada and the United States it is considered a noxious weed.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ascensión: alrededores del cruce del río [near river crossing] Casas Grandes con la carr. [hwy] Juárez–Ascensión, 11 Jun 2005, 1180 m, R. Corral, M. Vargas & H. Gutiérrez RCD7150 (UACJ).

35. Avena sativa* L., Sp. Pl. 1: 79. 1753.

FIGURE 34

Annual. Culms 40–180 cm tall, prostrate to erect when young, becoming erect at maturity. Sheaths smooth or scaberulous; ligules 3–8 mm long, acute; blades 8–45 cm long, 3–14 (25) mm wide, scaberulous. Panicles (6)20–40 cm long, 5–15 cm wide, nodding. Spikelets(18)25–32 mm (to 50 mm in naked oats), with 1–2 florets (to 7 in naked oats); disarticulation not occurring, the florets remaining attached even when mature. Glumes subequal, (18)20–32 mm long, 9- to 11-veined; calluses glabrous; lemmas 14–18 mm long, usually indurate (membranous in naked oats), usually glabrous, sometimes sparsely strigose, apex erose to dentate, longest teeth 0.2–0.5 mm long, awns usually absent, 15–30 mm when present, arising in the middle $\frac{1}{2}$ 3, straight or weakly twisted and weakly geniculate; lodicules with a lobe or tooth on the wings, this sometimes very small; anthers (1.7)3–4.3 mm long, 2n = 42.

DISTRIBUTION AND HABITAT. *Avena sativa*, a native of Eurasia, is widely cultivated in cool, temperate regions of the world, including North America. Several forms are grown, of which the most distinctive are naked oats. These differ from typical forms as indicated in the description and in having caryopses that fall.

MEXICO. Chihuahua. SPECIMENS EXAMINED. Bocoyna: 1.1 km N of San Juanito near large lumber mill, 24 Sep 1988, 2200 m, P.M. Peterson & Annable 5868 (ENCB, US); 20 km S of San Juanito on road to Creel and 3 km S of Bocoyna, 24 Sep 1988, pine forest, 2200 m, P.M. Peterson & Annable 5874 (ENCB, US). Chihuahua: La Campana; Potrero El Plan, 4 km Ote [W], carr. [hwy] Panamericana, 5 Sep 1973, lotes producción de semilla [seed-production lots], 1500 m, Valdés-Reyna VR-92 (RELC). Matamoros: 19.3 km S of Villa Matamoros on Hwy 45 to Durango, 3 Oct 1989, grassland, 1910 m, P.M. Peterson & R.M. King 8251 (US). Práxedis G. Guerrero: a 2 km del poblado [village] Práxedis G. Guerrero (San Ignacio), Rancho Escuela de la Univ. Autónoma de Ciudad Juárez, 5 May 1995, maleza de acequia [weed of ditch], 1090 m, R. Corral, Bye, A. Domínguez, K. Chico & A. Soutyrine RCD6079 (UACJ); Rancho Escuela, 16 Aug 1997, I. Enriquez, S. Ordoñez, L. Sushii, S. Carrasco, A. Perales & N. Loya IEA8 (UACJ). Temosachi: Nabogame, 22 Jun 1988, 1800 m, Laferr. 1366 (ARIZ).

Avenella (Bluff & Fingerh.) Drejer

Plants usually perennial, sometimes annual; caespitose or tufted. Culms hollow, erect. Leaves usually mainly basal, often forming a dense tuft; sheaths open; auricles absent; ligules membranous, decurrent, rounded to acuminate; blades often all or almost all tightly rolled or folded and some flat, sometimes most flat, others rolled or folded. Inflorescences terminal panicles, open or contracted; disarticulation above the glumes, beneath the florets. Spikelets with 2(3) florets in all or almost all spikelets, florets usually bisexual, sometimes viviparous; rachillas

hairy, usually prolonged more than 0.5 mm beyond the base of the distal floret, sometimes terminating in a highly reduced floret. Glumes subequal to unequal, usually exceeding the adjacent florets, often exceeding all florets, 1- to 3-veined, acute to acuminate; calluses antrorsely strigose; lemmas obscurely (3)5- to 7-veined, rounded over the back, apex truncate-erose to 2–4-toothed, awned, awns usually attached on the lower ½ of the lemmas, occasionally subapical, straight to strongly geniculate, slightly to strongly twisted proximally, straight distally; paleas shorter than the lemmas, 2-keeled, keels often scabrous; lodicules 2, lanceolate to ovate-lanceolate, usually entire; anthers 3; ovaries glabrous; styles 2. Caryopsis oblong; embryos about ½ the length of the caryopsis. x = 7.

Avenella, a segregate of Deschampsia includes one species widely distributed in America. It grows in cool, damp habitats throughout the world.

Avenella flexuosa (L.) Drejer, Fl. Excurs. Hafn. 32. 1838.
 Aira flexuosa L., Sp. Pl. 1: 65. 1753. Deschampsia flexuosa (L.) Trin., Mém. Acad. Imp. Sci. Saint-Pétersbourg, Sér. 6, Sci. Math., Seconde Pt. Sci. Nat. 1: 66. 1836.

FIGURE 35

Perennial; densely caespitose. Culms 30-80 cm long, erect or geniculate at the base, usually with 2 nodes. Leaves mostly basal, sometimes forming a basal tuft; sheaths smooth, glabrous; ligules 1.5-3.6 mm long, rounded to acute; blades 12-25 cm long, strongly rolled, 0.3-0.5 mm in diameter, abaxial surfaces smooth or scaberulous, glabrous or hairy, often scaberulous or hairy proximally and essentially smooth and glabrous distally, adaxial surfaces scabrous, flag leaf blades 5-8 cm. Panicles 5-15 cm long, (2)4-12 cm wide, narrow to open, often nodding; branches ascending to spreading, flexuous, smooth or scaberulous. Spikelets 4-7 mm long, ovate or U-shaped. Glumes exceeded by or subequal to the adjacent florets, 1-veined, acute; lower glumes 2.7-4.5 mm long; upper glumes 3.5-5 mm long; callus hairs to 1 mm long; lemmas 3.3-5 mm long, scaberulous or puberulent, hairs to 0.1 mm long, apex acute, erose to 4-toothed, awns 3.7-7 mm long, attached near the base of the lemma, strongly geniculate, geniculation below the lemma apex, distal segment 2.5-4.5 mm long, pale; anthers 2-3 mm long. 2n = 14, 26, 28, 32, 42.

DISTRIBUTION AND HABITAT. Avenella flexuosa grows on dry, often rocky, slopes and in woods and thickets, often in disturbed sites. It is primarily eastern in distribution, with records from west of the Great Lakes and Appalachians probably being introductions. It is also known from Mexico, Central America, South America, Borneo, the Philippines, and New Zealand.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: 38 km W of hwy 45 on road towards Benito Juárez, 17 Oct 1992, pinyon woodlands, 2230 m, *P.M. Peterson & Annable 12575* (US). Peterson 20039*, *F. Sánchez Alvarado & E.P. Gómez Ruíz* (CIIDIR, US). Ocampo: Parque Nacional "Cascada de Basaseachic," 25 Abr [Apr] 1986, 1700 m, *Spellenberg, Soreng, R. Corral & T. Lebgue 8474* (NMC).

Blepharidachne Hack.

Perennial, rarely annual; caespitose, from a knotty base, often mat-forming. Culms often decumbent and rooting at the lower nodes, frequently branched above the bases, forming short spur shoots at the ends of long internodes; internodes minutely pubescent. Leaves clustered at the bases of the primary and spur shoots; basal sheaths shorter than the internodes; ligules of hairs or absent; blades linear to triangular, convolute to conduplicate, or flat to plicate, sharp, those of the upper leaves usually exceeding the inflorescences. Inflorescences terminal, compact panicles, exserted or partially included in the upper sheath(s). Spikelets laterally compressed, subsessile or pedicellate, with 4 florets per spikelet; disarticulation above the glumes but not between the florets. Glumes subequal to each other and the lowest lemma, rounded or weakly keeled, 1-veined, awn-tipped or unawned; lowest 2 florets in each spikelet staminate or sterile; third floret pistillate or bisexual; lemmas rounded on the back, 3-veined, mostly glabrous but pilose across the bases and on the margins, strongly 3-lobed, lateral lobes wider than the central lobes, all lobes ciliate on 1 or both margins, lower lemmas slightly shorter to slightly longer than the lemmas; lodicules absent; anthers 2 or 3 (rarely 1); style branches 2. Distal florets rudimentary, 3-awned, plumose, or hairy. Caryopsis laterally compressed. x = 7.

The four species of *Blepharidachne* are restricted to the Americas, growing in arid and semi-arid regions of the United States, Mexico, and Argentina. One species occurs in our study area.

37. Blepharidachne bigelovii (S. Watson) Hack., Monogr. Phan. 6: 261. 1889.

Plants caespitose, from a firm, often knotty base. Culms 6–20 cm tall, freely branched at and above the bases. Sheaths usually with a tuft of hairs on either side of the collars, often puberulent on the backs; ligules to 0.3 mm long; blades 1–2 cm long, less than 1 mm wide, involute, convolute to conduplicate, firm, harshly puberulent, stiffly arcuate, lower blades deciduous. Panicles 15–30 mm long, 10–15 mm wide, exserted or partially included in the upper 2, subopposite, subtending sheaths; rachises and branches puberulent. Spikelets 5–7 mm long; glumes nearly equal to the lowest lemmas in the spikelets, exceeded by the distal

florets, thin, translucent, smooth or the vein scaberulous, subacute; lower glumes 5-6 mm long; upper glumes about 6 mm long; lowest florets staminate, 4-5 mm long; second florets sterile, about 5 mm long, lateral lobes 1-3 mm long; paleas of lowest 2 florets reduced, membranous; third florets pistillate, third lemmas 5.5-6 mm long, lateral lobes 3-4.5 mm long, awned, central awns 2.5-3 mm long; paleas of third florets slightly longer than the lemmas; anthers 2(1), 1.2-1.5 mm long. Caryopsis 1.5-2 mm long, 2n = 14.

DISTRIBUTION AND HABITAT. Blepharidachne bigelovii grows on rocky slopes in western Texas and adjacent areas of New Mexico and in Coahuila and Zacatecas, Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. **Juárez**: 5 km SW of Cd. Juárez in the extreme N end of Sierra Juárez, 17 Apr 1992, matorral de gobernadora-lechuguilla [governor's lechuguilla scrub], 1250 m, *Spellenberg & J. Bacon 10992* (CIIDIR, NMC).

Bothriochloa Kuntze

Perennial; caespitose or stoloniferous. Culms with pithy internodes. Leaves basal or cauline, not aromatic; sheaths open; auricles absent; ligules membranous, sometimes also ciliate; blades usually flat, convolute in the bud. Inflorescences terminal, panicles of subdigitate to racemosely arranged branches, each branch with (1)2 to many rames, branches not subtended by modified leaves; rames with spikelets in heterogamous sessile-pedicellate pairs, internodes with a translucent, longitudinal groove, often villous on the margins; disarticulation in the rames, beneath the sessile spikelets. Spikelets dorsally compressed; sessile spikelets with 2 florets; lower glumes rounded, several-veined, sometimes with a dorsal pit, margins clasping the upper glume; upper glumes somewhat keeled, 3-veined; lower florets hyaline scales, unawned; upper florets bisexual; upper lemmas with a midvein that usually extends into a twisted, geniculate awn, occasionally unawned; anthers 3. Pedicels similar to the internodes. Pedicellate spikelets reduced or well-developed, sterile or staminate, unawned. Caryopsis lanceolate to oblong, somewhat flattened; hila punctate, basal; embryos about $\frac{1}{2}$ as long as the caryopsis. x = 10.

Bothriochloa is a genus of about 35 species that grow in tropical to warm-temperate regions. Nine are native to North America.

KEY TO SPECIES OF BOTHRIOCHLOA

- 1. Axis of the inflorescence (rachis) 1–2 times as long as the racemes; racemes (8)10–40 per inflorescence; culms generally (1.5)2–4 mm thick near the base.
 - 2. Inferior racemes generally longer than the panicle axis, the panicle flabelate.
 - 2. Inferior racemes generally shorter than the panicle axis, the panicle oblong.

 Bothriochloa barbinodis (Lag.) Herter, Revista Sudamer. Bot. 6(5–6): 135. 1940. Andropogon barbinodis Lag., Gen. Sp. Pl. 3. 1816.

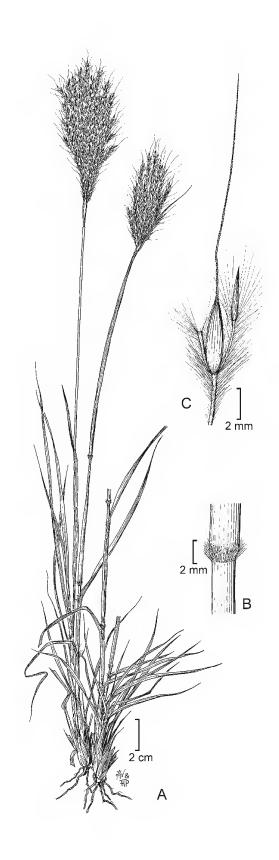

FIGURE 36

Culms 60-120 cm tall, rarely more than 2 mm thick, erect, geniculate at the base, often branched at maturity, not glaucous below the nodes; nodes hirsute, the hairs 3-4 mm long, mostly erect to ascending, tan or off-white. Leaves cauline; ligules 1–2 mm long, often erose; blades 20–30 cm long, 2–7 mm wide, not glaucous, glabrous or sparingly pilose near the throat. Panicles 5-14(20) cm on the larger shoots, oblong to somewhat fanshaped, silvery-white; rachises 5-10 cm long, straight, exserted or partially included in the sheath, with numerous branches; branches 4-9 cm long, erect, with several rames; rame internodes with a membranous groove wider than the margins, margins densely pilose, longest hairs 3-7 mm long, concentrated distally. Sessile spikelets 4.5-7.3 mm; lower glumes short pilose, with or without a dorsal pit; awns 20-35 mm; anthers 0.5-1 mm long, often remaining within the spikelet. Pedicellate spikelets 3-4 mm long, narrowly lanceolate, sterile. 2n = 180.

DISTRIBUTION AND HABITAT. Bothriochloa barbinodis is a common species, at 500–1,200 m, along roadsides, drainage ways, and gravelly slopes in desert grasslands from the southwestern United States through Mexico and Central America to Bolivia and Argentina.

39. *Bothriochloa laguroides* (DC.) Herter, Revista Sudamer. Bot. 6(5–6): 135. 1940. *Andropogon laguroides* Cat., Pl. Horta Mons. 78. 1813.

FIGURE 37

Culms 35–115(130) cm tall, usually less than 2 mm thick, erect or geniculate at the base, branched at maturity; nodes short hirsute with erect hairs, or glabrous. Leaves usually basal to sometimes cauline on robust plants, usually glaucous; ligules 1–3 mm; blades 5–25 cm long, 2–7 mm wide, flat to folded, mostly glabrous. Panicles 4–12(14) cm long, narrowly oblong or lanceolate, silvery-white or light tan; rachises 4–8 cm long, with more than 10 branches; branches 1–5.5 cm long, erect-appressed, rarely with axillary pulvini, lower branches shorter than the rachises, usually with more than 1 rame; rame internodes with a

FIGURE 37. Bothriochloa laguroides var. laguroides. A. Habit. B. Inflorescence branch. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

groove wider than the margins, margins copiously hairy, hairs 3–9 mm long, at least somewhat obscuring the spikelets. Sessile spikelets 2.5–4.5 mm long, ovate, somewhat glaucous, apex blunt; lower glumes glabrous or hirtellous, rarely with a dorsal pit; awns 8–16 mm; anthers 0.6–1.4 mm. Pedicellate spikelets 1.5–2.5(3.5) mm long, shorter than the sessile spikelets, sterile. 2n = 60.

DISTRIBUTION AND HABITAT. Bothriochloa laguroides grows in well-drained soils of grasslands, prairies, roadsides, river bottoms, and woodlands, often on limestone, usually at 20–2100 m. It has two varieties; Bothriochloa laguroides var. torreyana (Steud.) M. Marchi & Longhi-Wagner is found in Chihuahua.

Bothriochloa laguroides has been confused with Bothriochloa saccharoides (Sw.) Rydb., a more southern species that differs from B. laguroides in having pilose leaves, a narrow central groove in the internodes and pedicels, and panicle branches with axillary pulvini.

40. Bothriochloa perforata (Trin. ex E. Fourn.) Herter, Revista Sudamer. Bot. 6(5–6): 135. 1940. Andropogon perforatus Trin. ex E. Fourn., Mexic. Pl. 2: 59. 1886. Bothriochloa barbinodis var. perforata (Trin. ex E. Fourn.) Gould, Southw. Naturalist 3: 212. 1959.

Perennial plants, densely tufted. Culms 50–100 cm tall, geniculate at base, nodes plicate-pubescent to short barbed. Sheaths glabrous; ligules 2–3 mm long, membranous, blades 17–30 cm long, 2–4 mm wide, attenuate to the apex, flatened, glabrous or sparsely pilose adaxially; inflorescences 5–10 cm long, oblong, subtended by the superior sheath, racemes 4–8, 5–7 cm long, pseudo-digitate, agglomerate in a short rachis, straight, union of the rachis and pedicels densely long-viloses; sessile spikelets 4–6 mm long, bisexual, short pilose at base; lower glumes 4–6 mm long, scarce-pilose, with a pit at central part, upper glumes glabrous; bisexual lemmas 2.3–2.6 mm long, awn 18–25 mm long,

geniculate, twisted below; pedicelate spikelets 3.8–4 mm long, steriles, with only 1 floral wrap, unawned, coriaceous.

DISTRIBUTION AND HABITAT. Bothriochloa perforata grows in pine forests, oak-juniper forests, desert scrub, and grasslands at elevations of 2,150–2,616 m. Known from United States, Mexico, and South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Jiménez: carr. [hwy] 45 Parral-Torreón, 20 km al N de Río Florido, 15 Sep 1970, 1850 m, *L.Ma. Villarreal* 3690 (ENCB).

41. Bothriochloa springfieldii (Gould) Parodi, Gram. Bonaer. (ed. 5): 120. 1958.

FIGURE 38

Culms 30–80 cm long, erect, unbranched; nodes prominently bearded, hairs 3–7 mm long, spreading, silvery-white. Leaves mostly basal; ligules 1–2.5 mm long; blades 5–30 cm long, 2–3(5) mm wide, flat to folded, glabrous or sparsely hirsute adaxially, pilose near the throat. Panicles 4–9 cm long, oblong to fan-shaped; rachises 1–5 cm long, with 2–9 branches; branches 4–8 cm long, longer than the rachises, with 1(2) rames; rame internodes with a membranous groove wider than the margins, margins densely white-villous, hairs 5–10 mm long, obscuring the sessile spikelets. Sessile spikelets 5.5–8.5 mm long, lanceolate; lower glumes densely short-pilose on the lower ½, sometimes with a dorsal pit; awns 18–26 mm long; anthers 1–1.5 mm long. Pedicellate spikelets 3.5–5.5 mm long, sterile. 2n = 120.

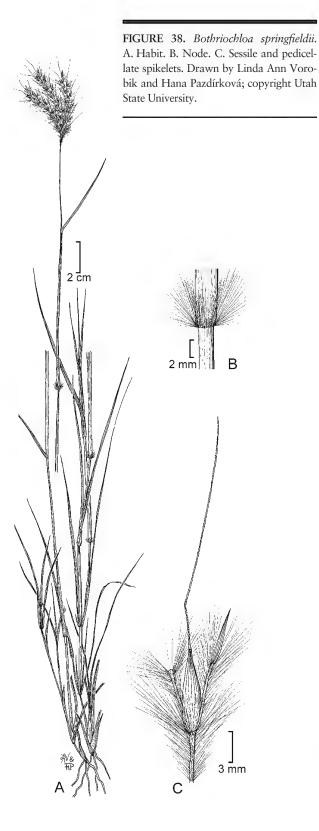

DISTRIBUTION AND HABITAT. Bothriochloa springfieldii grows in rocky uplands, ravines, plains, sandy areas, and roadsides from southern Utah to western Texas and Mexico at 900–2,500 m and, as a disjunct, in northwest Louisiana. It differs from *B. barbinodis* in its less robust habit, narrower blades, longer nodal hairs, and fewer, more hairy panicle branches

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: 28 km al sur [S] de Samalayuca, 21 Oct 74, pastizal halófito [halophyte grassland], 1400 m, *Valdés-Reyna VR-793* (RELC). 42. Bothriochloa wrightii (Hack.) Henrard, Blumea 4(3): 520. 1941. Andropogon wrightii Hack., Flora 68(8): 139. 1885.

FIGURE 39

Culms to 70 cm long, erect, sparingly branched; nodes glabrous or hirsute, hairs about 1 mm. Leaves cauline, glaucous; ligules 1–2 mm; blades 15–25 cm long, 3–7 mm wide, glabrous. Panicles 5–6 cm long, oblong to fan-shaped; rachises 1–3 cm long, with 4–5 branches; branches 4–6 cm long, lacking axillary pulvini, with 1 raceme; raceme internodes with stiff, 1–3 mm

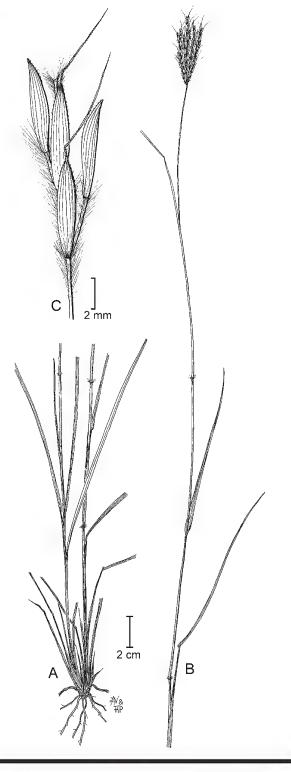

FIGURE 39. Bothriochloa wrightii. A. Habit. B. Culm and inflorescence. C. Inflorescence branch. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

marginal hairs. Sessile spikelets 5.5-7 mm long, lanceolateelliptic; lower glumes glabrous, usually without a dorsal glandular pit; awns 10-15 mm long, twisted, once-geniculate; anthers about 3 mm. Pedicellate spikelets staminate, subequal to the sessile spikelets. 2n = 120.

DISTRIBUTION AND Навітат. Bothriochloa wrightii grows in rocky grasslands and shrubby slopes of the pineoak woodlands of southern Arizona, New Mexico, Texas, and northern Mexico at 1,200-1,800 m. It was last collected in the United States in 1930. It differs from B. barbinodis in its glaucous foliage, short, fan-shaped panicles, and large, pedicellate spikelets.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Buenaventura: km 11 S Buenaventura, 23 Oct 1954, Hern.-Xol. & C. Tapia N-164, 215 (US); J. Passini & M.F. Robert 6580 (ENCB). Bouteloua Lag.

Annual or perennial; synoecious; habit various, caespitose, stoloniferous, or rhizomatous. Leaves usually mostly basal; sheaths open; ligules of hairs, membranous, sometimes

ciliate. Inflorescences terminal, panicles of 1–80 solitary, spikelike branches, exceeding the upper leaves; branches not woody, 1-sided, usually racemose on elongate rachises, sometimes digitate or subdigitate, with 1-130 sessile to subsessile spikelets in 2 rows, axes terminating in a spikelet or extending beyond the base of the distal spikelet. Spikelets closely imbricate, appressed to pectinate, laterally compressed or terete, with 1–2(3) florets, lowest floret in each spikelet bisexual, distal florets staminate or sterile; disarticulation at the base of the branches or above the glumes. Glumes unequal or subequal, 1 or both glumes equaled or exceeded by the distal floret, 1-veined, acute or acuminate, sometimes shortly awned; lower glumes usually shorter than the lowest floret; lemmas of lowest florets entire, 2-, 3-, or 4-lobed, 3-veined, veins usually extended into 3 short awns; paleas of lowest florets 2-veined, veins sometimes excurrent; distal floret(s) staminate or sterile, similar to the lowest floret in shape, size, and venation to sterile and reduced to an awn column with well-developed awns or to a flabellate scale. x = 10.

Bouteloua, a genus of the Western Hemisphere with its center of diversity in Mexico, has 60 species (Herrera Arrieta et al., 2004, 2008; Peterson et al., 2015). There are 26 species of Bouteloua in Chihuahua, all native. Several species are important forage grasses, and some are important constituents of the native Mexican grasslands. Two that are particularly important in Mexico and Chihuahua are B. curtipendula and B. gracilis. These were major constituents of the shortgrass prairie that once covered the drier portions of the Great Plains. Both are excellent forage species.

KEY TO SPECIES OF BOUTELOUA

- 1. Unisexual spikelets on dioecious or monoecious plants; pistillate spikelets different in form and size to the staminate 1. Bisexual spikelets, all similar in form and size. 2. Spikelets 3 per spike (branch); central spikelet shortly-stipitate, 3-flowered, first floret bisexual, the laterals staminate. 3. Culms generally more than 15 cm tall; blades 3–12 cm long; lateral spikelets well-developed, staminate B. erecta 3. Culms less than 15 cm tall; blades 1-5 cm long; lateral spikelets reduced rarely staminate but with reduced lemmas B. diversispicula 2. Spikelets (1)2 to several per spike (branch); or with 1 to 2 (3) rudiments, these sometimes represented by an awn. 4. Spikes falling when mature, bearing 1–12 spikelets; spikelets persistent on the spikes. 5. Inflorescence branches (spikes) with 2-22 spikelets. 6. Spikes 20–80 per culm, if less than 15, then the spikes less than 1 cm long. 7. Spikes 9-25(35) per culm, 8-10 mm long, bearing 2-6 spikelets; central awn of the rudiment 2.5-5 mm longB. warnockii 7. Spikes 20-80 per culm, 10-30 mm long, bearing 2-13(20) spikelets; central awn of the rudiment 5-10 mm
 - - 8. Culms with 4-7 nodes; upper glumes 3.5-5.5 mm long; inflorescences both terminal and axillary, the
 - 8. Culms with 1 or 2(3) nodes; upper glumes 5.5-8 mm long; inflorescences only terminal, bearing 2-6 spikelets B. curtipendula
 - 6. Spikes 1–15 per culm, if up to 20 then more than 1 cm long.
 - 9. Annual plants; rudimentary florets tipically reduced to a cylindrical column with 3 awns, these 5–8 mm long;

9. Perennial plants; rudimentary florets well-developed, staminate or neutral, when 3-awned the awns of variable sizes; spikelets appressed or spreading from the branch axis, not widely separated from each other. 10. Spikes bearing 2–5 spikelets; upper glume hairy.
11. Inflorescence 7–15 cm long; spikelets 4–6.5 mm long; lower glume ¾ as long as the upper glume; awns of rudimentary floret 1–3 mm long
11. Inflorescence 3–6 cm long; spikelets 7–10 mm long; lower glume ½ as long as the upper glume; awns of rudimentary floret 7–10 mm long
10. Spikes bearing 5–20 spikelets; upper glabrous or hairy.
12. Leaf blades involute along entire length, apically rigid and spine-like, densely lanate-pubescent
adaxially and glabrous at maturity
12. Leaf blades flat, at least the proximal ½, the distal ½ often involute at maturity, the apex never rigid
or spine-like, glabrous, hirsute or bearing papillose hairs adaxially.
13. Rachis of spikes and upper glume dorsally hairy; spikes 3–8, 7–10 mm long
13. Rachis of spikes and upper glume glabrous to scabrous; spikes 5–12, 15–40 mm long.
14. Spikes 2–5(7) cm long with (9)12–22 spikelets, inserted to near the apex of the spike
14. Spiles 1.5. 2.0 am long with 5.12 amilelets inserted on the lower 14. 3% of the amile
14. Spikes 1.5–3.0 cm long with 5–12 spikelets, inserted on the lower ½–¾ of the spike. 15. Plants with well-developed rhizomes, hard and knotty; spikelets 9–13 mm long
B. radicosa
15. Plants without rhizomes; spikelets 6–9 mm long
16. Inflorescence of a single unilateral spike.
17. Annual plants, generally small, 7–23 (35) cm tall; few-leaved
17. Perennial plants, generally greater than 25 cm tall; many-leaved.
18. Spike rachis prolonged 2–10 mm beyond the insertion of the distal spikelet, ending in a semi-rigid needle;
upper glumes with papillose-based hairs, at least in some spikelets.
19. Blades 1.5-5 cm long, evidently distichous, rigid, distributed homogeneously along the culm; plants
generally glabrous, except pubescent on the adaxial surface of the leaf blade; spikelets 3-3.5 mm
wide, the rachis prolonged 2–5 mm beyond the distal spikelet
19. Blades 5–18 cm long, not distichous; plants hirsute; spikes 6–9 mm wide, the rachis prolonged 5–10
mm beyond the distal spikelet
18. Spike rachis not extending beyond the distal spikelet insertion; upper glume pubescent or glabrous. 20. A single spike per culm; rachis of spike and upper glume glabrous to scabrous, the rachis clearly
arched B. scorpioides
20. 1–3(4) spikes per culm; rachis of spike and upper glume pilose or hirsute, often with long papillose-
based hairs, the rachis straight
16. Inflorescence of 2 or more unilateral spikes.
21. Upper glumes (at least in some spikelets) hirsute with papillose-based hairs.
22. Spike rachis prolonged 2–10 mm beyond the distal spikelet insertion.
23. Blades 1.5-5 cm long, evidently distichous, rigid, distributed homogeneously along the culm; plants
generally glabrous, except pubescent on the adaxial surface of the leaf blade; spikelets 3-3.5 mm
wide, the rachis prolonged 2–5 mm beyond the distal spikelet
23. Blades 5–18 cm long, not distichous; plants hirsute; spikes 6–9 mm wide, the rachis prolonged 5–10
mm beyond the distal spikelet
24. Lemma 3.5–4 mm long; spikes 3–8, 1–3 cm long; plants caespitose or stoloniferous, never rhizomatous
24. Lemma 4–5.5 mm long; spikes 2 or 3(6), 1.3–5(7) cm long; plants subrhizomatous
21. Upper glumes glabrous or pubescent but the hairs never papillose-based.
25. Culm internodes lanose-pubescent, at least below; base of rachis and branches lanose-pubescent
B. eriopoda
25. Culm internodes glabrous; base of rachis and branches glabrous.
26. Annual

26. Perennial.
27. Inflorescence with 2 or 3(4) spikes.
28. Culms conspicuously branched, geniculate, usually with 4 to 5 nodes, bearded on the branche axiles
28. Culms never branched, erect, usually with 1 or 2(3) nodes, glabrous on the branch axils B. gracilis
27. Inflorescence with 3–30 spikes.
29. Plants rhizomatous to subrhizomatous.
30. Spikelets 3–4.5 mm long; plants strongly rhizomatous
31. Lemma of bisexual floret glabrous to scaberulous with 3 awns; spikelets inserted on rachis in zigzag fashion
29. Plants not rhizomatous.
32. Lemma of bisexual floret glabrous to scaberulous with 3 awns; spikelets inserted on rachis in zigzag fashion
32. Lemma of bisexual floret pubescent at the base with a single awn; spikelets inserted on rachis in straight or arched fashion.
33. Lemma of bisexual floret bearded below and pilose on the veins, hairs 0.5–0.8 mm long; spikes 2 or 3(6), 1.3–5(7) cm long bearing 40–80 spikelets
33. Lemma of bisexual floret slightly pubescent below, at least on the basal margins and not pilose on the veins; spikes (2)4–9(11), 1–3 cm long, bearing 20–55 spikelets
B. barbata

43. *Bouteloua aristidoides* (Kunth) Griseb., Fl. Brit. W. I. 537. 1864. *Dinebra aristidoides* Kunth, Nov. Gen. Sp. (quarto ed.) 1: 171. 1815.

FIGURE 40

Annual; tufted. Culms 4-60 cm tall, outer culms of a tuft decumbent, sometimes geniculate, branched at the lower nodes. Ligules 0.2-0.5 mm long, membranous, lacerate or ciliate; blades 2-5(9) cm long, 0.7-2 mm wide, flat or folded, adaxial surfaces sometimes with papillose-based hairs, margins usually with papillose-based hairs near the ligules. Panicles 2.5-10.5 cm long, with (1)4–15 widely spaced branches; branches 5–45 mm long, deciduous, densely pubescent (at least basally), with 2-10 spikelets per branch, the spikelets appressed, axes extending 2–10 mm beyond the base of the terminal spikelets, apex entire; disarticulation at the base of the branches, the break forming a sharp tip. Spikelets appressed. Proximal spikelet on each branch with 1 floret; lower glumes 1.5-3.5 mm long, glabrous, narrow to subulate; upper glumes 5.5-6.2 mm long, densely pubescent, at least on the basal 1/2; lemmas 5.8-6 mm long, acuminate, unawned; lowest paleas almost as long as the lemmas, bifid, glabrous; rachillas prolonged beyond the florets for about 0.5 mm. Distal spikelets with 1 bisexual and 1 rudimentary floret; glumes unequal, glabrous, minutely scabrous on the keels; narrowly acute or acuminate; lower glumes 1.5-2 mm; upper glumes 5-6 mm long, glabrous or sparsely pubescent basally, often divergent; lowest lemmas 6-8 mm long, veins pubescent, lateral veins excurrent as short (to 1 mm) awns, acuminate, midvein extended into a setaceous tip or a short awn; lowest paleas 5-7 mm long, bifid, veins often excurrent as short awns; anthers about 2.5 mm long, yellow or yellow and red; distal florets reduced to a pubescent, 3-awned, awn column, awns 2–7 mm long, exserted. Caryopsis 2.5–3 mm long, 2n = 40

There are two varieties; only the typical variety grows in Chihuahua.

DISTRIBUTION AND HABITAT. *Bouteloua aristi-doides* var. *aristidoides* grows in dry mesas, plains, and washes from near sea level to about 2,000 m. Its range extends from California to west Texas and Mexico.

44. Bouteloua barbata Lag., Varied. Ci. 2(4): 141. 1805.

Annual or short-lived perennial; tufted, sometimes with stolons. Culms 1-75 cm tall, prostrate, decumbent, or erect, sometimes rooting at the lower nodes; lower internodes glabrous. Leaves basal or cauline; sheaths usually glabrous, except for tufts of long hairs on either side of the collars; ligules 0.5-2 mm long, membranous, ciliate; blades 0.5-10 cm long, 0.7-4 mm wide, adaxial surfaces usually sparsely pubescent with a few papillose-based hairs basally. Panicles 0.7-25 cm long, with (2)4–9(11) branches; branches 10–30 mm long, persistent, straight to arcuate, glabrous, scaberulous, or with papillose-based hairs, with 20-55 spikelets, axes terminating in a well-developed spikelet; disarticulation above the glumes. Spikelets 2.5-5 mm long, pectinate, with 1 bisexual and 2 rudimentary florets; glumes unequal, glabrous, sometimes scaberulous, apex sometimes shortly bilobed, acuminate or mucronate; lower glumes 0.7-1.5 mm; upper glumes 1.5-2.5 mm long, glabrous, scabrous, or strigose, hairs not papillose-based; lowest lemmas 1.7–4 mm long, densely pilose, at least on the margins, 3-awned, awns 0.5-3 mm long, central awns flanked by 2 membranous lobes; lowest paleas 1.5-4 mm long, pubescent on the margins, 4-lobed, 2-awned, awns 1-2 mm; anthers 0.4-0.7 mm; rachilla internodes subtending second florets terminating in a dense tuft of hairs; second florets rudimentary, 1.5-4 mm long, 2-lobed, lobes rounded, 3-awned, awns 0.5-4 mm long; rachilla internodes subtending third florets with glabrous or puberulent apex; third florets rudimentary, flabellate, unawned. Caryopsis to 1 mm. 2n = 20.

DISTRIBUTION AND HABITAT. Boutelous barbata extends from the southwestern United States to southern Mexico. There are three varieties of *B. barbata*; two of them grow in Chihuahua.

KEY TO VARIETIES OF BOUTELOUA BARBATA

Bouteloua barbata var. barbata

DISTRIBUTION AND HABITAT. Bouteloua barbata var. barbata grows in loose sands, rocky slopes, and washes, often on disturbed soils, usually at elevations below 2,000 m. Its range extends from the southwestern United States to northern Mexico.

Bouteloua barbata var. rothrockii (Vasey) Gould, Ann. Missouri Bot. Gard. 66(3): 403. 1979.

FIGURE 41

DISTRIBUTION AND HABITAT. Bouteloua barbata var. rothrockii grows on dry slopes and sandy flats, mostly at 750–1,700 m. It grows throughout the southwestern United States and Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Janos: Chihuahua-Sonora Border, Rancho Carretas, 30 Aug 1939, 1460 m, *L. H. Harvey 1642* (US). *Reeder, C. Reeder & Soderstrom 3491* (US).

45. Bouteloua breviseta Vasey, Contr. U.S. Natl. Herb. 1(2): 58. 1890.

FIGURE 42

Perennial; sometimes caespitose, sometimes rhizomatous, rhizomes 1–3 mm thick, short or elongate, scaly. Culms 20–40 cm tall, erect, somewhat woody at the base, branching at the base and, in late fall, sometimes at the aerial nodes; nodes usually 4–5; internodes glabrous, distal portions of the lower internodes with a thick, white, chalky bloom. Ligules 0.1–0.2 mm long, of hairs; blades 1–4(7) cm long, 0.5–2 mm wide, flat basally, involute and arcuate to reflexed distally. Panicles 2–4 cm

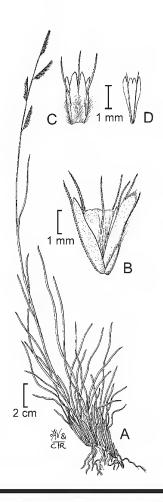

FIGURE 41. Bouteloua barbata var. rothrockii. A. Habit. B. Spikelet. C. Lower lemma. D. Lower palea. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

long, with 1–3(4) branches; branches 15–37 mm long, persistent, straight to slightly arcuate, mostly appressed, stramineous, with 30-45 spikelets, branches terminating in a reduced, needlelike, 2-5 mm spikelet; disarticulation above the glumes. Spikelets pectinate, with 1 bisexual floret and 1–2 rudimentary florets; glumes acute to acuminate, glabrous or sparsely short-hairy, hairs not papillose-based; lower glumes 2-2.5 mm; upper glumes 2-3.5 mm; lowest lemmas 2.5-4 mm long, sparsely to densely hairy, 3-awned, awns slightly shorter than the lemma bodies, central awns flanked by 2 membranous lobes; lowest paleas about 4.5 mm long, mostly or completely glabrous, sometimes puberulent distally, acute to acuminate, unawned, veins not excurrent; second florets about 4.5 mm long, 3-awned, awns 3-5 mm long; rachilla internodes subtending second florets with densely pubescent apex; third florets, if present, flabellate scales, 1-awned. Caryopsis 1–1.2 mm long, about 0.4 mm wide. 2n = 20.

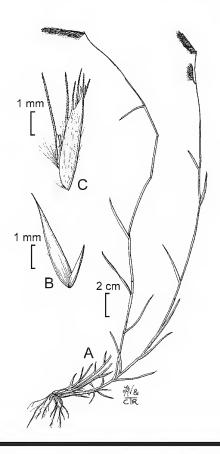

FIGURE 42. Bouteloua breviseta. A. Habit. B. Glumes. C. Lower floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

DISTRIBUTION AND HABITAT. Bouteloua breviseta is locally abundant on gypsum soils in southeastern New Mexico and Texas. It also grows in the state of Chihuahua, Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Coyame: km 100 carr. [hwy] Chihuahua–Ojinaga, 18 Oct 74, matorral [scrub] de lechugilla, 1650 m, *Valdés-Reyna VR-718* (RELC). Ahumada: Médanos de Samalayuca, 26 Oct 73, suelo muy arenoso [very sandy soil], *Valdés-Reyna VR-446* (RELC). Jiménez: Sta Eulalia Mts., *C.G. Pringle 414* (US); *E.  Bouteloua chihuahuana (M. C. Johnston) Columbus, Aliso 14(3): 227. 1996. Bouteloua rigidiseta (Steud.) Hitchc. var. chihuahuana M. C. Johnston, Southw. Naturalist 27: 29. 1982.

Perennial. Culms 40–50 cm tall, slender, weak, in small mats. Sheaths glabrous to slightly scabrous; ligule 0.5 mm long, a ciliate ring; blades 6–17 cm long, 1–2 mm wide, involute, apiculate, glabrous to scaberulous, especially over the margins,

occasionally with sparse pubescence adaxially. Inflorescence 3-6 cm long, bearing 2-8 spikes of 0.8-1.6 mm long including the awns, erect or ascending, deciduous at maturity, rachis glabrous, bearing 2–5 spikelets; rachis flaccid, never bifurcate or trifurcate at the apex. Spikelets 5–7 mm long, permanently inserted into the spikes; glumes unequal, lower glumes 3-4 mm long, very narrow, acuminate, sparsely pubescent at the base to glabrous, upper glumes 6-8 mm long, acuminate, scabrous-ciliate on the main vein to the base; lemma 5-7 mm long including the awns, sparsely pubescent on the veins; paleas of equal size, as long as the lemma body, glabrous; anthers 2.5-3 mm long, white-yellowish; rudimentary florets 1 to 2, lemma of the rudimentary floret 7-9 mm long, reduced to 3 awns flattened, strong, scabrous, exceding the awns of the fertile lemma, alternate with intermediate awned lobes; second rudimentary floret similar to the first but smaller.

DISTRIBUTION AND HABITAT. Bouteloua chihuahuana is endemic to Chihuahua and grows in desert scrublands at 1,500 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Camargo: Northern end of Sierra de Las Pampas, 11.5 km NW of Las Pampas on road to Cd. Camargo, M.C. Johnston & F. Chiang 8811 (MEXU); Allred 5820 (ANSM) Sierra de las Pampas, near Cd. Camargo, K.W. Allred, T. Columbus & Valdés-Reyna 5820 (ANSM, RSA); Sierra de las Pampas, 11.5 km of Las Pampas, on road to Cd. Camargo, T. Columbus 2289 (RSA).

47. Bouteloua chondrosioides (Kunth) Benth. ex S. Watson, Proc. Amer. Acad. Arts 18: 179. 1883. Dinebra chondrosioides Kunth, Nov. Gen. Sp. (quarto ed.) 1: 173, t. 53. 1815. Perennial; caespitose, without rhizomes or stolons. Culms (10)30-60 cm tall, erect, unbranched. Leaves mostly basal; sheaths mostly glabrous, margins often long-ciliate distally; ligules 0.3-0.6 mm long, of hairs; blades 1-10 cm long, 1-2.5(3) mm wide, flat, glaucous, bases with papillose-based hairs on the margins, similar hairs sometimes present on either or both surfaces. Panicles 2.5-6 cm long, with 3-8(10) branches; branches (8)10-15 mm long, densely pubescent, with 8-12 spikelets, axes extending to 5 mm beyond the base of the terminal spikelets, apex entire; disarticulation at the base of the branches. Spikelets appressed, all alike, 7-7.5 mm long, with 1 bisexual and 1 rudimentary floret; glumes evidently hairy; lower glumes 2.5–4.5 mm long; upper glumes 4.5–6.5 mm long; lowest lemmas 4.7-6.2 mm long, hairy distally, 3-lobed, lobes unawned or shortly awned; lowest paleas 5-7.2 mm long, pubescent along the veins and on the margins, bifid, veins excurrent as short awns; anthers 2.8-4 mm long, yellow; upper florets rudimentary, glabrous, 3-awned, awns scabrous, sometimes arising from a short but evident awn column, central awns sometimes with a membranous margin, awns scabrous. Caryopsis about 2.5 mm long, about 0.9 mm wide. 2n = 20, 22, 40.

DISTRIBUTION AND HABITAT. Bouteloua chondrosioides grows on dry, rocky slopes and grassy plateaus at 200–2,500 m. Its range extends from southern Arizona and

western Texas to Costa Rica. It resembles *B. eludens* in having pubescent panicle branches, but *B. eludens* usually has 12–16 branches 5–11 mm long with 2–6 spikelets whereas *B. chrondrosoides* usually has 3–8 branches 10–15 mm long with 8–12 spikelets per branch.

 Bouteloua curtipendula (Michx.) Torr., Explor. Red River Louisiana 300. 1853. Chloris curtipendula Michx., Fl. Bor.-Amer. 1: 59. 1803.

Panicles 13–30 cm long, secund, with (12)30–80 reflexed branches; branches (5)10–30(40) mm long, deciduous, with (1)2–7(15) spikelets, axes terminating 3–5 mm beyond the base of the terminal spikelets, apex entire; disarticulation at the base of the branches. Spikelets 6–8 mm long, appressed, all alike, with 1 bisexual floret and 1–2 sterile, rudimentary florets; glumes unequal, glabrous or scabrous; lower glumes 2.5–6 mm long, ½ or more as long as the upper glumes; upper glumes 5.5–8 mm; lowest lemmas 3–6.5 mm long, glabrous or scabrous-strigose, often minutely rugose, acute or inconspicuously 3-lobed, 3-veined,

veins usually excurrent as short mucros or awns to 6 mm; central mucros or awns not flanked by membranous lobes; lowest paleas acute, unawned; anthers 1.5–3.5 mm long, yellow, orange, red, or purple; distal floret(s) 0.4–3.5 mm long, sterile, variable, usually a glabrous lemma having a short membranous base, no palea, and 3 unequally developed awns, central awns 1.5–7 mm. 2n = (20), 40, 41–103.

Bouteloua curtipendula is a common, often dominant or codominant species in open grasslands and wetlands of the drier portions of the central grasslands of North America. It is highly regarded as a forage species and is also an attractive ornamental. Its range extends from United States, Mexico, and Central America to western South America.

KEY TO VARIETIES OF BOUTELOUA CURTIPENDULA

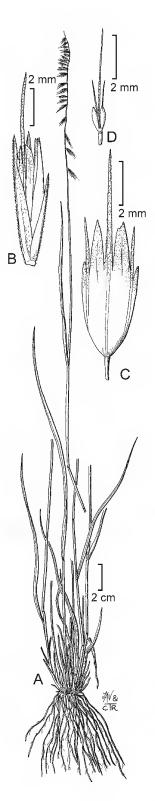

- 1. Plants forming small mats, with rhizomes or stolons.

Bouteloua curtipendula var. caespitosa Gould & Kapadia, Brittonia 16(2): 203, f. 43, 1964.

FIGURE 43

DISTRIBUTION AND HABITAT. Bouteloua curtipendula var. caespitosa grows in grasslands, xerophyl scrubs, oak and pine forests, and tropical deciduous forests at 1,500–2,450 m. It ranges from United States and Mexico to Central and South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Aldama: NE of Aldama along Chihuahua hwy 16, 14 Sep 1972, 1360 m, J. Bouteloua curtipendula var. tenuis Gould & Kapadia, Brittonia 16(2): 201, f. 42. 1964.

DISTRIBUTION AND HABITAT. Bouteloua curtipendula var. tenuis grows in grasslands and scrub of Larrea tridentata at 1,980–2,500 m. In Mexico it occurs in Aguascalientes, Chiapas, Chihuahua, Coahuila, Distrito Federal, Durango, Guanajuato, Jalisco, Michoacán, Morelos, Nuevo León, Oaxaca, Puebla, Querétaro, San Luis Potosí, Tamaulipas, Tlaxcala, Veracruz, and Zacatecas.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta et al. (2004).

49. Bouteloua dactyloides (Nutt.) Columbus, Aliso 18(1): 63. 1999. Sesleria dactyloides Nutt., Gen. N. Amer. Pl. 1: 65. 1818. Buchloë dactyloides (Nutt.) Engelm., Trans. Acad. Sci. St. Louis 1: 432, pl. 12 & 14, f. 1–17. 1859. Bulbilis dactyloides (Nutt.) Raf. ex Kuntze, Revis. Gen. Pl. 2: 763. 1891.

Perennial; usually dioecious; strongly stoloniferous, sometimes mat-forming. Culms 1-30 cm tall, erect, solid, mostly unbranched, those of the pistillate inflorescences much shorter than those of the staminate inflorescences; nodes mostly glabrous. Leaves basally tufted, not clustered or strongly distichous; sheaths open, rounded, often sparsely pilose near the collar; ligules membranous or of hairs; blades usually flat basally, curling when dry, glabrous or sparsely pilose, apex involute. Staminate inflorescences terminal, usually exceeding the upper leaves, panicles of 1–3(4) racemosely arranged, unilateral, pectinate branches; branches not enclosed at maturity, spikelets densely crowded in 2 rows. Staminate spikelets with 2 florets; glumes unequal, glabrous, 1- or 2-veined; lemmas 3-veined, glabrous, unawned; anthers brownish to red or orange. Pistillate inflorescences terminal, panicles, partially hidden within bracteate sheaths; branches 2-3(4), 2.5-4.5 mm long, bur-like, with 3-5(7) spikelets; disarticulation at the base of the panicle branches. Pistillate spikelets with 1 floret, almost completely enclosed by the upper glumes; lower glumes irregular and reduced; branch axes and lower portion of upper glumes globose, white, indurate, terminating in 3 awn-like teeth; lemmas firmly membranous, glabrous, 3-veined, unawned or shortly 3-awned. 2n = 20, 40, 56, 60.

DISTRIBUTION AND HABITAT. Bouteloua dacty-loides is a common grass in the central plains of North America. It is usually dioecious, infrequently monoecious, and rarely synoecious.

Bouteloua diversispicula Columbus, Aliso 18(1): 63. 1999.
 Cathestecum brevifolium Swallen., J. Wash. Acad. Sci. 27(12): 500. 1937.

Perennial; polygamous or dioecious; caespitose, forming dense, small clumps, stoloniferous, stolons thin, internodes to 10(12) cm long, straight or only slightly arching. Culms 5–15 cm tall, erect or geniculate. Leaves primarily basal; lower sheaths densely villous basally, mostly glabrous or sparsely pilose distally, throats densely ciliate; blades 1-5 cm long, 1-2 mm wide, stiff, flat to involute, abaxial surfaces glabrous, adaxial surfaces scabrous and pilose, margins scabrous. Panicles with 3-10 branches; branches divergent, dimorphic, with staminate or bisexual spikelets, spikelets usually reddish or purple. Staminate branches with all spikelets similar; lower glumes to 1 mm long, often reduced to a scale, 0- to 1-veined; upper glumes ½-2/3 as long as the spikelets, narrowly lanceolate, usually glabrous, veins sometimes sparsely pilose, glumes of the lateral spikelets about 2.5 mm long, acute or acuminate, those of the central spikelets about 3 mm long, minutely lobed and mucronate; lowest lemmas to 3 mm long, sparsely pilose, with short lobes, mucronate between the lobes; distal lemmas to 2.5 mm long, similar to the lowest lemmas but with deeper lobes; anthers 0.7-2 mm. Bisexual branches: lateral spikelets poorly developed, lower glumes to 1 mm long, upper glumes to 2.5 mm long, veins pilose, florets greatly reduced, sometimes just a cluster of awns, sterile (rarely staminate); central spikelets with glumes similar to those of the lateral spikelets; lowest florets pistillate, lemmas about 3 mm long, scabrous, lobed, lobes about 1/4 as long as the lemmas, awned from the sinuses, awns slightly exceeding the lobes; distal florets staminate or sterile, about 2.5 mm long, deeply lobed, awned from the sinuses, awns exceeding the lobes by 1-3 mm. 2n = 20, 40, 60, and 80.

DISTRIBUTION AND HABITAT. Bouteloua diversispicula extends from Arizona, to Mexico, El Salvador, and Honduras.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: SW Chihuahua, Aug 1885, E. Palmer 66 (US). Ojinaga:

Ca. 9 km of Ojinaga on the Hwy to Chihuahua City, 20 Oct 1972, matorral desertico [desert scrub] 820 m, F. Chiang, T. Wendt & M.C. Johnston 9723 (MEXU).

51. Bouteloua eludens Griffiths, Contr. U.S. Natl. Herb.14(3): 401, pl. 78–80a. 1912.

FIGURE 45

Perennial; without rhizomes or stolons. Culms 20-60 cm tall, unbranched. Leaves mostly basal; sheaths glabrous or sparsely ciliate near the throat, basal sheaths papery, becoming pale; ligules to 0.5 mm long, of hairs; blades to 15 cm long, 1-1.5(3) mm wide, flat, lower leaves variously hirsute or scabrous, upper leaves glabrous, with scabrous margins. Panicles 6-10 cm long, with (8)12-16(20) branches; branches 5-11 mm long, deciduous, pubescent, with (2)4-6 spikelets, axes extending about 5 mm beyond the terminal spikelets, apex entire; disarticulation at the base of the branches. Spikelets appressed, all alike, with 1–2 bisexual florets and 1 rudimentary floret; glumes silvery-hirsute over and between the veins, at least basally, apex acute, acuminate, or shortly awned; lower glumes 5-6 mm long; upper glumes 6-7 mm long, sericeous over the veins and elsewhere, hairs about 0.5 mm long, apex mucronate; lowest florets bisexual, pistillate, or staminate; lowest lemmas 6-7 mm long, pubescent between the veins and over the midveins, midveins excurrent into acuminate or setaceous lobes about the same length as the lateral lobes, not flanked by membranous lobes, lateral veins excurrent from the lateral lobes for 0.5-2 mm; lowest paleas as long as the lemmas, pubescent, acute to acuminate, unawned; second florets usually staminate, pistillate, or bisexual (rarely rudimentary); second lemmas 8-10 mm long; usually well-developed, pubescent, lateral veins extended into 0.5-4 mm awns, midveins extended into a flattened awn 1-5 mm long; second paleas as long as the second lemmas, pubescent, usually with 2 short awns; third florets, if present, pubescent, variable, resembling the second floret, a 3-awned structure with 2 membranous scales, or a prolongation of the rachilla. Caryopsis about 5 mm long, about 1.5 mm wide. 2n = 20.

DISTRIBUTION AND HABITAT. Bouteloua eludens grows on dry, rocky slopes and rolling desert flats at 1200–1800 m. It is known from Cochise, Santa Cruz, and eastern Pima counties in Arizona, adjacent portions of New Mexico, and to Chihuahua and Sonora, Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Beetle,(1977), Espejo Serna et al. (2000), and Herrera Arrieta and Cortés Ortiz (2010).

52. Bouteloua erecta (Vasey & Hack.) Columbus, Aliso 18(1): 63. 1999. Cathestecum erectum Vasey & Hack., Bull. Torrey Bot. Club 11: 37. 1884.

Perennial; polygamous; caespitose, forming dense, small clumps, stoloniferous, stolons thin, internodes 15–40 cm long, strongly arching. Culms 10–30 cm tall, erect or geniculate, glabrous. Leaves primarily basal; lower sheaths overlapping,

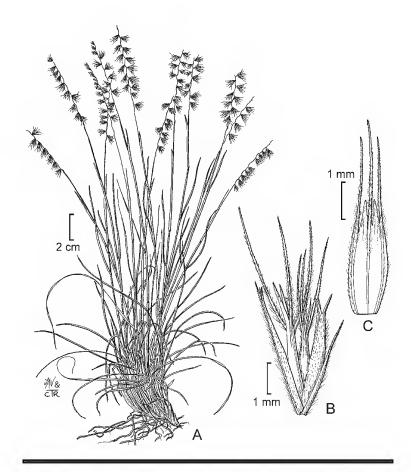

FIGURE 45. Bouteloua eludens. A. Habit. B. Spikelet. C. Fertile lemma. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

densely villous basally, throats pilose; upper sheaths not overlapping, glabrous; ligules about 0.3 mm long; blades 3–12 cm long, 1-1.5 mm wide, involute or flat, glabrous abaxially, scabrous and sparsely pilose adaxially, hairs to 2 mm. Panicles with 5-7 branches; branches about 5 mm long, dimorphic, staminate or bisexual, the 2 forms sometimes on different plants, sometimes mixed within a panicle, spikelets of 1 form all staminate, bisexual form with pistillate (sometimes bisexual) central spikelets and well-developed staminate or sterile lateral spikelets, spikelets frequently pale green. Staminate branches: all spikelets similar; lower glumes about 1 mm; upper glumes glabrous or almost so, those of the lateral spikelets about 3 mm long, those of the central spikelets about 4 mm; lemmas similar, about 3 mm long, glabrous, irregularly lobed, unawned, sometimes mucronate. Bisexual branches: glumes villous; lateral spikelets with staminate or sterile florets; lemmas of lateral spikelets about 3 mm long, glabrous or sparsely pubescent, irregularly lobed, awned from the sinuses, awns hispid, equaling or occasionally exceeding the lobes; anthers 1.7–2.3 mm long; central spikelets with the lowest floret pistillate, distal florets staminate or sterile; lowest lemmas glabrous or sparsely pubescent, lobed, lobes about $\frac{1}{3}$ as long as the lemmas, awned from the sinuses, awns glabrous, subequal to the lobes or the central awns slightly longer; distal florets similar to those of the lateral florets, awns 1–2 mm longer than the lobes. 2n = 20.

DISTRIBUTION AND HABITAT. Bouteloua erecta grows on dry hills in the Great Bend region of western Texas and in northern Mexico. It ranges from United States and northern Mexico to Central America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: Creel, along airstrip southeast of Creel, 16 Jul 1972, grass in dry part of field, 7240 ft, Bye 2344 (MEXU). 53. Bouteloua eriopoda (Torr.) Torr., Pacif. Railr. Rep. 4(5): 155. 1856. Chondrosum eriopodum Torr., Not. Milit. Reconn. 154. 1848.

FIGURE 46

Perennial; often short rhizomatous, stoloniferous, stolons long, densely woolly pubescent. Culms 20-60(75) cm long, wiry, decumbent, rooting at the lower nodes; lower internodes densely woolly pubescent. Sheaths mostly glabrous or sparsely pilose, usually pilose near the ligules; ligules 0.1-0.4 mm long, of hairs; blades 2.5-6 cm long, 0.5-2 mm wide, scabrous adaxially, margins with papillose-based hairs basally. Panicles (1)2-16 cm long, with (1)2-8 branches; branches 14-50 mm long, persistent, densely woolly pubescent basally, with 8-18 spikelets, axes terminating in entire, sometimes scarious apex; disarticulation above the glumes. Spikelets pectinate, with 1 bisexual floret and 1 rudimentary floret; glumes unequal, smooth or scabrous; lower glumes 2-4.5 mm; upper glumes 4.5-8(9) mm long, glabrous, scabrous, or with hairs, hairs to 0.5 mm long, not papillose-based; lower lemmas 4-7 mm long, pubescent basally, glabrous or sparsely puberulent distally, acuminate, central awns 0.5-4 mm long, lateral awns absent or shorter than 1 mm long; lower paleas acuminate, unawned; anthers 1.5-3 mm long, yellow to orange; rachilla segment to second florets about 2 mm

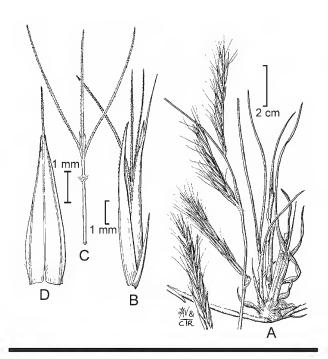

FIGURE 46. *Bouteloua eriopoda*. A. Habit. B. Spikelet. C. Upper floret. D. Lower lemma. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

long, with a distal tuft of hairs; upper florets rudimentary, an awn column terminating in 3 awns, the awns 4–9 mm long. Caryopsis 2.5–3 mm long. 2n = 20, 21, 28.

DISTRIBUTION AND HABITAT. Boutloua eriopoda grows on dry plains, foothills, and open forested slopes, often in desert shrublands, and also in waste ground. It is usually found between 1,000–1,800 m but extends to 2,500 m. Once a dominant in much of its range, under heavy grazing *B. eriopoda* persists only where protected by shrubs or cacti because it is highly palatable. Its range extends from the southwestern United States to northern Mexico.

FIGURE 47

Perennial; usually densely caespitose, often with short, stout rhizomes. Culms 24-70 cm tall, not woody basally, erect, geniculate, or decumbent and rooting at the lower nodes, not branched from the aerial nodes; nodes usually 2-3, glabrous or puberulent; lower internodes glabrous. Leaves mainly basal; sheaths glabrous or sparsely hirsute; ligules 0.1-0.4 mm long, of hairs, often with marginal tufts of long hairs; blades 2–12(19) cm long, 0.5–2.5 mm wide, flat to involute at maturity, hairs usually present basally. Panicles 0.5(12.5) cm long with 1–3(6) branches, these racemosely inserted on the rachis; branches 13-50(75) mm long, persistent, arcuate, scabrous, without papillose-based hairs, with 40-130 spikelets, terminating in a spikelet; disarticulation above the glumes. Spikelets pectinate, with 1 bisexual and 1 rudimentary floret; glumes mostly glabrous or scabrous, midveins sometimes with papillose-based hairs; lower glumes 1.5-3.5 mm; upper glumes 3.5-6 mm; lowest lemmas 3.5-6 mm long, pubescent at least basally, 5-lobed, central and lateral lobes veined and awned, awns 1–3 mm long, central awns flanked by 2 membranous lobes; lower paleas about 5 mm long, shallowly bilobed, veins excurrent for less than 1 mm; rachilla internodes subtending second florets with a distal tuft of hairs; anthers 1.7-2.9 mm long, yellow or purple; upper florets sterile, 0.9–3 mm long, lobed almost to the base, lobes rounded, 3-awned, awns 1-3 mm, equal. Caryopsis 2.5-3 mm long, about 0.5 mm wide. 2n = 20, 28, 35, 40, 42, 60, 61, 77, 84.

DISTRIBUTION AND HABITAT. Bouteloua gracilis grows in pure stands in mixed prairie associations and disturbed habitats, usually on rocky or clay soils and mainly at elevations of 300–3000 m. Its native range extends from Canada to central Mexico.

55. Bouteloua hirsuta Lag., Varied. Ci. 2(4): 141. 1805.

Perennial; densely or loosely caespitose, occasionally stoloniferous. Culms 15-75 cm tall, erect or decumbent, sometimes branched basally, sometimes branched aerially, nodes 3-6, internodes glabrous or sparsely to densely pubescent with papillose-based hairs. Leaves basal or mainly cauline; sheaths mostly glabrous, finely scabrous, or pubescent, pilose near the ligules; ligules 0.2-0.5 mm long, of hairs; blades 1-30 cm long, 1-2.5 mm wide, flat to involute, papillose-based hairs often present on both surfaces, usually present on the bases of the margins. Panicles usually with 0.7-18 cm rachises bearing 1-6 branches, the branches sometimes digitate; branches 10-40 mm long, persistent, straight, with 20-50 spikelets, axes extending 5-10 mm beyond base of the terminal spikelets; disarticulation above the glumes. Spikelets pectinate, green to dark purple, with 1 bisexual floret and 1-2 rudimentary florets; glumes acuminate or awn-tipped; lower glumes 1.4-3.5 mm long; upper glumes 3-6 mm long, midveins with papillose-based hairs; lowest lemmas 2-4.5 mm long, pubescent, 1- to 3-awned, central (or only) awns 0.2-2.5 mm long, not flanked by membranous lobes, lateral lobes acuminate, unawned or with awns no longer than the central awn; lower paleas ovate, unawned; anthers 2-3.4 mm long, cream or yellow; rachilla internodes subtending second florets glabrous or pubescent, sometimes with a distal tuft of hairs; second lemmas 0.5-2 mm long, bilobed, 3-awned, awns 2-4(6) mm; third lemmas, if present, minute, membranous scales, glabrous. Caryopsis 1.5–2.6 mm long. 2n = 20, 40, 50,60; numerous diploid numbers also reported.

Bouteloua hirsuta is a widespread species with two varieties.

KEY TO VARIETIES OF BOUTELOUA HIRSUTA

1. Cumis inspidulous with papinose-based nams below the nodes

Bouteloua hirsuta var. hirsuta.

Bouteloua hirsuta var. palmeri Vasey ex Beal.

.

raleza 1: 347. 1870.

DISTRIBUTION AND HABITAT. Bouteloua hirsuta var. glandulosa grows in grasslands and thorn scrublands at 2,100 m. It occurs in the United States, Mexico, and Central America.

Bouteloua hirsuta var. glandulosa (Cerv.) Gould, J. Arnold

Arbor, 60(2):320. 1979. Erucaria glandulosa Cerv., Natu-

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 10 mi SW of El Ojito, 12 Sep 2006, 1902 m, *P.M. Peterson 20027, F. Sánchez Alvarado & E.P. Gómez Ruíz* (CIIDIR, US). Chihuahua: 25 km W of Chihuahua, 20 Aug 1939, *L.H. Harvey 1540* (US).

DISTRIBUTION AND HABITAT. Bouteloua hirsuta Lag. var. hirsuta grows in open grasslands, desert scrub, and oak-pine forests at 1,800–2,370 m. It occurs in Canada, the United States, and Mexico.

56. Bouteloua johnstonii Swallen, Proc. Biol. Soc. Wash. 56: 79. 1943.

Perennial; densely caespitose, rhizomatous. Culms 10–30(45) cm tall, strongly based. Leaves basal; sheaths glabrous, margins hyaline; ligule 0.5 mm long, a fringe of hairs, leaf blades 5–12 cm long, 1–2 mm wide, curved, involute for entire length, apically rigid and spine-like, densely lanate-pubescent adaxially and glabrous at maturity. Panicle axis 7–10 cm long, tip subulate, composed of 6–12 unilateral branches, branches 8–15 mm long, 5–10 mm wide, bearing 7–11 appressed spikelets, sessile. Spikelets 5–9 mm long, cuneate, laterally compressed, falling entire; glumes unequal, glabrous, often purplish, lanceolate, apex acute to setaceously attenuate, thinner than fertile lemma, membranous, 1-keeled, 1-veined, lateral veins absent, lower glume

3–4 mm long, upper glume 5–7 mm; lemma 5–7 mm long, ovate, keeled, 3-veined, apex lobulate, 3-awned, awns 2–3 mm long, subequal, central awn among 2 lobes; palea 4–4.2 mm long, glabrous; anthers 2–2.2 mm long, yellowish, filaments pubescent; apical sterile florets 1–2, rudimentary, sterile lemma 3-awned, awns 2–3 mm. Caryopsis 2–2.2 mm long, yellow, oblong-elipsoid.

DISTRIBUTION AND HABITAT. Bouteloua johnstonii is an endemic species in the north of Mexico that grows in gypsum and calcium soils in scrub communities and grasslands. It occurs in the states of Chihuahua and Coahuila.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Camargo: Sitio 17B, Rancho Epigmenia, 25 Aug 2015, 27°46′37.7″N, 104°09′10.8″W [27.77722°N, 104.15306°W], matorral desértico con [desert scrub with] *Yucca carnerosana*, 1627 m, *J. Santos & A. Olivas s.n.* (CIIDIR, UACH).

 Bouteloua karwinskii (E. Fourn.) Griffiths, Contr. U.S. Natl. Herb. 14(3): 394. 1912.

Perennial; rhizomatous. Culms 20-55 cm tall, erect, branched from the base, internodes glabrous. Sheaths shorter than internodes, glabrous, marginally cilate, with some large hairs over the throat; ligule 0.3 mm long, a ciliate ring; blades 3-9 cm long, 1-2 mm wide, flat, scabrous, loosely pilose on the adaxial surface, curved. Panicle 1.5-5(8) cm long, conformed by 3-6 persistent spikes (branches), branches 1-1.8 cm long, spaced out and almost erect, containing 16-32 spikelets. Spikelets 3-3.5(4) mm long, disarticulating over the glumes; glumes unequal, glabrous, sparsely pubescent over the keel, lower glumes 1.5-2 mm long, narrow, acuminate, upper glumes 2-2.5 mm long, wider than the lower glume; lemma of the bisexual floret 2.5-3.2 mm long, sparsely plicate-pubescent over the veins and the base, the lateral veins excurrent into strong awns, awns 1-1.5 mm long, not exceeding the acute apex of the lemma. Rudimentary florets (1)2, lemma of the first rudimentary floret 1 mm long with 3 veins prolonged into awns of 1.5 mm long, second rudimentary floret 1 mm long including the 3 scabrous awns, rachilla glabrous at the base of the rudimentary floret. Caryopsis 0.7-1 mm long, light yellow to brown when mature, narrowly elliptic. 2n = 20.

DISTRIBUTION AND HABITAT. Bouteloua karwinskii grows on grasslands and scrub communities over gypsum soils. It is an endemic species in Mexico known from Coahuila, Nuevo León, San Luis Potosí, and Zacatecas and now found in Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Aldama: Sitio 27B, Torreño # 3, 2 Sep 2015, 29°04′45″N, 105°45′49″W [29.07917°N, 105.76361°W], matorral subinerme [mostly unarmed scrub] con Fouquieria splendens, Tecoma stans, Acacia neovernicosa & Cassia wislizenii, 1380 m, J. Santos & A. Olivas 528B (CIIDIR, UACH).

58. Bouteloua media (E. Fourn.) Gould & Kapadia, Brittonia 16(2): 196, f. 35. 1964. Atheropogon medius E. Fourn., Mexic. Pl. 2: 139. 1886.

Perennial; caespitose, basally nudose. Culms 80-200 cm tall, erect, with 4-7 nodes purple, simple, occasionally branched on the superior nodes. Sheaths scabrous or papillose-hirsute, sparsely pilose on the margins and near the throat; ligules 0.5-0.7 mm long, membranous, minutely ciliate; blades 30-45 cm long, 4-6(9) mm wide, flat, scabrous or papillose-hirsute. Inflorescence 20-25 cm long, terminal and axillary, branches 20-40, 1-2 cm long, inclined, deciduous when mature, bearing 7–13(20) spikelets, rachis scabrous, spikelets congested; axillary inflorescences shorter than the nodes, placed below the terminal node, with thinner axes, short, with fewer number of spikelets per branch. Spikelets 5-6 mm long, some abortive, inserted in the spikes; glumes unequal, lower glumes 3.8-4.5 mm long, narrow, acute, attenuate or setaceous, with membranous base, scabrous to pubescent on the keel, upper glumes 4.5-5.5 mm long, widely lanceolate, acute to acuminate, sparsely pilous to scabrous on the keel; lemmas of the bisexual floret 5-5.5 mm long, scabrous to puberulent, 3-veined, veins excurrent into 3 short awns, scabrous; paleas equal in size about as long as the lemma, minutely pubescent; anthers 2.8–3.5 mm long, yellow or orange; rudimentary florets 1-2, sterile, lemma of the first floret rudimentary, 3-3.5 mm long, membranous, 5-awned, awns 4-5 mm long, scabrous, central awn 5-10 mm long, strong and scabrous; lemmas of the second floret when present 2.5-3 mm long. Carvopsis 2.2-2.5 mm long, slender, yellow, ovoid to narrowly elliptic. 2n = 20.

DISTRIBUTION AND HABITAT. Bouteloua media grows in grasslands, scrub communities, and, less commonly, tropical forest. It ranges from Mexico to Central America and South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: West of Munérachi, 7 Sep 2003, matorral espinoso [thorny scrub], 1200 m, *P.M. Peterson & P. Catalán 17711* (US). Guadalupe: NE Chihuahua, vicinity of Rancho El Pino, ca 10 km SE of Sierra Rica, 23 Sep 1942, *R. Stewart 2406* (US).

59. Bouteloua parryi (E. Fourn.) Griffiths, Contr. U.S. Natl. Herb.14(3): 381, f. 37, pl. 73. 1912. Chondrosum parryi E. Fourn., Mexic. Pl. 2: 150. 1886.

FIGURE 49

Annual or short-lived perennial; tufted, sometimes stoloniferous. Culms 20–60 cm tall, erect or somewhat geniculate at the base. Leaves mostly basal; sheaths pubescent, usually with tufts of long hairs on either side of the collar; ligules 0.1–0.5 mm long, of hairs; blades 1–3 cm long, 1–2.5 mm wide, margins and usually both surfaces with papillose-based hairs. Panicles 2.5–10 cm long, with 4-8 branches; branches 20–35 mm long, persistent, with papillose-based hairs, with 40–65 spikelets, branches terminating in a spikelet; disarticulation above the glumes. Spikelets pectinate, with 1 bisexual floret and 2 rudimentary florets; glumes unequal; lower glumes about 2 mm long, glabrous or sparsely pubescent at the base, mucronate; upper glumes 3–4 mm long, keels with papillose-based hairs, apex bilobed, awned from

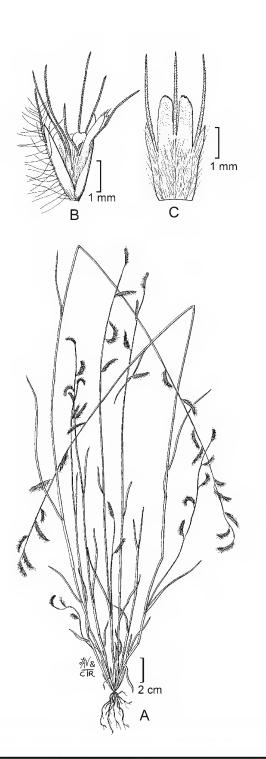

FIGURE 49. Bouteloua parryi. A. Habit. B. Spikelet. C. Lower lemma. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

between the teeth, awns to 0.7 mm long; lowest lemmas 3–4 mm long, pilose or villous proximally, 3-awned, awns 2–3 mm long, central awns flanked by 2 membranous lobes; lowest paleas about 2.5 mm long, 4-lobed, 2-awned; anthers 1.8–2 mm long, yellow; rachilla internodes subtending second florets with densely pubescent apex; second florets lobed nearly to the base, lobes ovate, awns 2–4 mm long, exceeding those of the lowest lemmas, third florets minute scales, glabrous, unawned or with a single awn. Caryopsis 1.3–1.5 mm long. 2n = 20.

DISTRIBUTION AND HABITAT. Bouteloua parryi grows on sandy slopes and flats at elevations from near sea level to 2,000 m. Its range extends from the southwestern United States to central Mexico; only Bouteloua parryi var. parryi occurs in Chihuahua.

FIGURE 50

Perennial; with a dense, hard, knotty base, rhizomatous, rhizomes 2-3 mm thick, with pale cataphylls, internodes 4-5 mm long. Culms (40)60-80 cm tall, erect, straight, unbranched. Sheaths strongly striate; ligules 0.5-1 mm long, of hairs; blades mostly basal, short and firm, 2-3 mm wide, bases with papillosebased hairs on the margins. Panicles 10-15 cm long, usually with 7-12 branches; branches (15)20-30 mm long, deciduous, with 8-11 spikelets, apex entire; disarticulation at the base of the branches. Spikelets 9-13 mm long, appressed, all alike, with 2 florets, lowest floret bisexual, upper florets pistillate, bisexual, or staminate; glumes acuminate, glabrous; lower glumes about 4 mm; upper glumes 5-6 mm; lowest lemmas 7-8 mm long, smooth, often shortly trilobed, 3-awned, awns excurrent from the lobes, central awns 2-3 mm long, not flanked by membranous lobes, lateral awns about 1 mm; lower paleas 6-7 mm long, unawned, sometimes mucronate; upper lemmas 9-10 mm long, central awns 6-8 mm long, lateral awns 5-6 mm; upper paleas similar to the lower paleas. Caryopsis 4–5 mm long, 0.75–1 mm wide. 2*n*= 60.

DISTRIBUTION AND HABITAT. Bouteloua radicosa grows on dry, rocky slopes at 1,000–3,000 m, from Arizona and southern New Mexico to southern Mexico.

FIGURE 51

Perennial; densely caespitose, bases hard, knotty, without rhizomes or stolons. Culms 25-60 cm tall, numerous, somewhat woody at the base, geniculate, branching profusely from the lower nodes; nodes usually 4–5; lower internodes glabrous, without a conspicuous, white, chalky bloom. Ligules 0.1-0.2 mm long, of hairs; blades 2-7 cm long, 1-2 mm wide, mostly flat but the tips involute. Panicles 1-3(5) cm long, with 1-3(4) branches; branches 10-35 mm long, persistent, ascending to widely divergent, becoming arcuate, dark, with 24-45(64) spikelets, branches terminating in a reduced, needlelike, 2-5 mm spikelet; disarticulation above the glumes Spikelets with 1 bisexual floret and 1-2 rudimentary florets; glumes acute to acuminate, glabrous or sparsely short-hairy, hairs not papillose-based; lower glumes 2-2.5 mm long; upper glumes 2-3.5 mm long; lowest lemmas 2.5-4 mm long, sparsely to densely hairy, 3-awned, awns slightly shorter than the lemma bodies, central awns flanked by 2 membranous lobes; lowest paleas about 4.5 mm long, mostly glabrous, sometimes puberulent distally, acute to acuminate, veins not excurrent, unawned; second florets about 4.5 mm long, 3-awned, awns 3-5 mm long; rachilla internodes subtending second florets with densely pubescent apex; third florets, if present, flabellate scales, 1-awned. Caryopsis 1-1.2 mm long, about 0.4 mm wide, 2n = 40.

DISTRIBUTION AND HABITAT. Bouteloua ramosa is locally common on rocky limestone slopes and flats among shrubs and Agave lecheguilla. Its range extends from the Trans Pecos region of western Texas to adjacent northern Mexico, particularly in the Chihuahuan Desert.

FIGURE 52

Perennial; caespitose, usually not dense, hard, or knotty, without rhizomes or stolons. Culms 15–65 cm tall, erect, geniculate, or decumbent, sometimes rooting at the lower nodes, usually branching from the aerial nodes. Sheaths glabrous or pubescent; ligules 0.2–0.3 mm long, membranous, ciliate; blades 5–20 cm long, 1–5 mm wide, bases with papillose-based hairs on the margins, both surfaces glabrous or pubescent. Panicles 4–14 cm long, with (3)7–12 branches; branches 10–20 mm long, with 2–8 spikelets, extending 4–6 mm beyond the base of the terminal spikelets, apex entire; disarticulation at the base of the branches. Spikelets 6–9 mm long, appressed, all alike, with

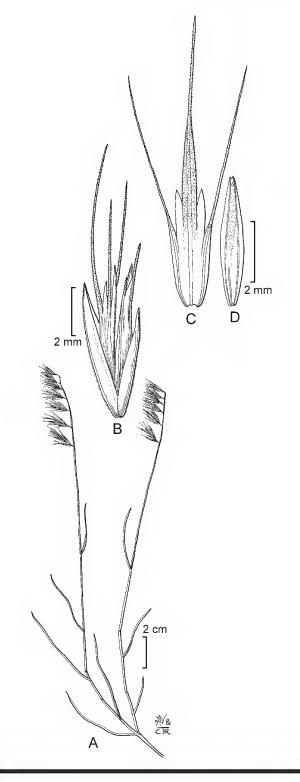

FIGURE 52. Bouteloua repens. A. Habit. B. Spikelet. C. Lemma. D. Palea. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

1 bisexual and 1 staminate (rarely rudimentary) floret; glumes glabrous, veins scabrous or strigose; lower glumes 4-7 mm long; upper glumes 4-9 mm long, mostly glabrous, sometimes scabrous or strigose over the veins, apex acute, unawned or awn-tipped, awns about 1 mm; lowest lemmas 4.5-8 mm long, usually glabrous, rarely pubescent basally, 3-awned, awns wide basally, central awns slightly longer than the lateral awns, often flanked by 2 membranous 0.5-1.5 mm long lobes; lowest paleas 6-8 mm long, bilobed, often shortly 2-awned; anthers 3-5.5 mm long, usually orange or yellow, occasionally red or purple; second lemmas 5.5-7 mm long, glabrous, 3-awned, central awns 4-10 mm long, often flanked by membranous lobes, lateral awns 2-10 mm long; second paleas 4-7 mm long; anthers less than those of the lowest florets; rachillas prolonged beyond the second florets as a short bristle. Caryopsis 3-4 mm long. 2n = 20, 40, 60.

DISTRIBUTION AND HABITAT. Bouteloua repens grows in open, usually hilly terrain on many soil types, from sandy ocean shores to montane slopes, reaching elevations of 2,500 m. Its native range extends from the southwestern United States to Mexico and Central America to Colombia and Venezuela; it also occurs in the Caribbean Islands.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: SW Chihuahua, Aug 1885, E. 63. Bouteloua scorpioides Lag., Gen. Sp. Pl. 5. 1816.

Perennial; mat-forming. Culms 10-20(30) cm tall, erect, few branched at the base. Leaves basal; sheaths glabrous, with hyaline margins, throats pilose with a tuft of hairs of 1-3 mm; ligules 0.5-1 mm long; blades 2.5-13 cm long, involute, filiform, recurved or flexuous. Inflorescence 1 spike, 2.5-4(5) cm long, unilateral, arched-recurved, persistent, insert in culm apex, bearing 35-90 spikelets. Spikelets 5-7 mm long, with 1 bisexual floret and 2 rudimentary, disarticulation above glumes; glumes subacute, glabrous, greenish or with purple spots, the lower 2-3 mm long, narrow, the second 4-7 mm; lemmas of the bisexual floret 3.5-5.5 mm long, basally bearded and densely pilose over the margins and veins of the inferior ½, veins excurrent in strong awns, 1.5-2 mm the central, 1-1.5 mm the lateral; anthers 3 mm long, orange; first rudimentary floret 5.5-6 mm long, 3-awned, awns 1.5-4 mm long, with a basal tuft of hairs. Caryopses 1.8-2.4 mm long, yellow to brown, angulose-triangular. 2n = 20.

DISTRIBUTION AND HABITAT. Bouteloua scorpioides grows in grassland, desert scrub, and pine–oak forests at 1,800–2,570 m. Its range extends into Mexico in Chihuahua, Distrito Federal, Durango, Guanajuato, Hidalgo, Jalisco, México, Morelos, Oaxaca, Puebla, Querétaro, San Luis Potosí, Tamaulipas, Tlaxcala, and Zacatecas.

FIGURE 53

Annual. Culms 3-35 cm tall, usually decumbent, occasionally erect, rarely branching; internodes glabrous. Sheaths smooth, deeply striate; ligules 0.1-0.2 mm long, of short hairs, sometimes with a few papillose-based hairs on either side; blades 2-8 cm long, 0.5-1.5 mm wide, flat to involute, adaxial surfaces mostly glabrous, often pilose basally. Panicles usually with only 1 branch (terminating the culm), or with 2-4 branches and subdigitate; branches 10-25(40) mm long, persistent, straight, arcuate, or circular, with 30-80 spikelets, axes terminating in a reduced spikelet; disarticulation above the glumes. Spikelets pectinate, with 1 bisexual floret and 1-2 rudimentary florets; glumes glabrous, sometimes scabrous distally, acute or acuminate; lower glumes 1.5-2.5 mm long; upper glumes 3.5-5 mm long; lowest lemmas 2.5-3.5 mm long, pilose over the veins, 3-awned, awns stout and flattened, central awns 1-2 mm long, flanked by 2 membranous lobes, lateral awns shorter than the central awns; lowest paleas obovate, unawned; rachilla internodes subtending second floret with densely pubescent apex; second floret reduced to an awn column with 3 awns of 5-6 mm; third floret, if present, flabellate scales. 2n = 20.

DISTRIBUTION AND HABITAT. Bouteloua simplex grows on rocky, open slopes in grassy and open shrub vegetation at 1,200–2,500 m. Its native range extends from the southwestern United States through Mexico and Central America to western South America.

65. Bouteloua trifida Thurb., Proc. Amer. Acad. Arts 18. 177. 1883.

FIGURE 54

Perennial; caespitose, older plants occasionally short rhizomatous. Culms 5-40 cm tall, slender, wiry, erect or slightly geniculate at the lower nodes; lower internodes glabrous, shorter than those above. Leaves mostly basal; sheaths glabrous, sometimes scaberulous, becoming flat, persistent; ligules 0.2-0.5 mm long, of hairs; blades 0.7-8 cm long, 0.5-1.5(2) mm wide, scaberulous, margins often with papillose-based hairs basally. Panicles 3-9 cm long, with 2-7 branches; branches 7-25 mm long, persistent, spreading, ascending, or appressed, straight to slightly arcuate, with 8-24(32) spikelets, axes terminating in a spikelet; disarticulation above the glumes. Spikelets appressed to pectinate, reddish-purple; with 1 bisexual floret and 1 rudimentary floret; glumes bilobed; lower glumes 1.7-3.4 mm long, slightly shorter than the upper glumes, veins excurrent to 0.6 mm; upper glumes 1.9-4 mm long, glabrous or pubescent, hairs not papillose-based, veins excurrent to 1 mm; lower lemmas 1.2-2.2 mm long, glabrous, sparsely appressed-pubescent along the veins or densely appressed-pubescent for much of their length and on the margins, trilobed, lobes veined, tapering into 3 awns, awns 2.2-6.6 mm long, central awns not flanked by membranous lobes; anthers 0.2-0.4 mm long, yellow; rachilla internodes glabrous; upper florets glabrous, 3-awned, awns equal, 2-7 mm. Caryopsis 0.8–1.5 mm long, 0.3–0.6 mm wide. 2n = 20.

DISTRIBUTION AND HABITAT. Bouteloua trifida grows on dry open plains, shrubby hills, and rocky slopes at 2,200–2,500 m. Its range extends from the southwestern United States to central Mexico. It is a drought-resistant species that is sometimes confused with *B. barbata*, but that species is annual, with the central awn flanked by 2 membranous lobes and the lowest paleas 4-lobed and 2-awned.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: near Chihuahua, 25 Aug 1885, C.G. Pringle 412 (US). Jiménez: Sta Eulalia plains, 1885, E. Wilkinson 205 (US). Valle de Zaragoza: 58 km N of Parral on Mex 24 towards Chihuahua, 14 Sep 1989, grassland, 1500 m, P.M. Peterson & Annable 8101 (US).

66. Bouteloua uniflora Vasey, Bot. Gaz. 16: 26. 1891.

FIGURE 55

Perennial; caespitose, without rhizomes or stolons. Culms 20–60 cm tall, stiffly erect, glabrous. Sheaths mostly glabrous, a few long hairs present near the ligules; ligules 0.2–0.5 mm long, of hairs; blades 6–16 cm long, 1–2 mm wide, involute when dry, glabrous, bases usually with papillose-based hairs on the margins. Panicles 5–10(14) cm long, with 15–70 branches; branches

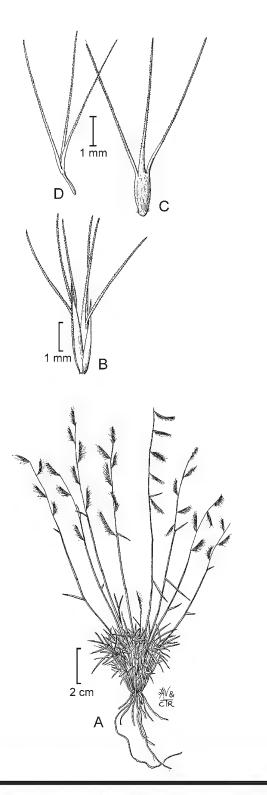

FIGURE 54. Bouteloua trifida. A. Habit. B. Spikelet. C. Lower lemma. D. Upper floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

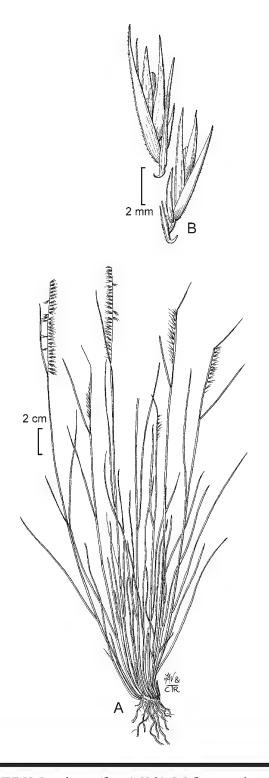

FIGURE 55. Bouteloua uniflora. A. Habit. B. Inflorescence branches. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

5-9 mm long, deciduous, scabrous, with 1 spikelet (lower branches occasionally with 2 spikelets), axes extending 3–4 mm beyond the terminal spikelets, apex entire; disarticulation at the base of the branches. Spikelets appressed, with 1 bisexual and 0 or 1 rudimentary florets; glumes acute to slightly cleft and minutely apiculate, midveins usually scabrous; lower glumes 2.5–4 mm long; upper glumes 6.2–8 mm long, mostly smooth, midveins usually scabrous; lowest lemmas 6–7.5 mm long, acute or minutely cleft, glabrous, unawned, sometimes mucronate; lowest paleas unawned, glabrous; anthers 2.5–3 mm long, bright yellow; second florets absent or reduced to 1 or 3 short awns, glabrous. Caryopsis about 3 mm long. 2n = 20.

DISTRIBUTION AND HABITAT. Bouteloua uniflora grows primarily in fertile, rocky, limestone soils of Texas and adjacent Coahuila, Mexico at 300–1,000 m. Plants in the region belong to Bouteloua uniflora var. coahuilensis Gould & Kapadia, which differs from Bouteloua uniflora var. uniflora, in having smaller (20–40 cm long, not 40–60 cm) and scapose rather than leafy culms, shorter leaf blades (6–12 cm versus 12–16 cm), and 15–40 rather than 50–70 panicle branches.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Aldama: km 100 carr. [hwy] Chihuahua-Ojinaga, 25 Nov 1994, matorral de gobernadora [governor's scrub], 1590 m, Y. Herrera & M.E. Siqueiros 1344 (CIIDIR). Guachochi: along río Corareachi, 30 Aug 2003, 1840–1900 m, P.M. Peterson & P. Catalán 17599 (CIIDIR, US). San Francisco del Oro: 21 km W of Parral and approx. 3.2 km N on dirt road to Torrencillo, 26 Sep 1988, grassland, 2000 m, P.M. Peterson & Annable 5964 (ENCB, US).

67. *Bouteloua warnockii* Gould & Kapadia, Southw. Naturalist 7(3-4): 176–181. 1962.

Perennial; caespitose, forming clumps 4-10 cm in diameter, lacking stolons and rarely having short rhizomes. Culms 20–35(50) cm tall, erect. Leaves mostly basal, bluish-green, more or less glaucous; sheaths mostly glabrous, hairs present distally; ligules 1-1.5 mm long, a fringe of hairs; blades 5-15(25) cm long, 1-1.5(2.5)mm wide, glaucous, erect or curving, involute when dry; mostly glabrous, ligular area with long and short hairs, bases usually with papillose-based hairs on the margins. Panicles 5–10(20) cm long, with 9-15(25) lax branches, branches 4-5.5 mm long, deciduous, scabrous, with 2-6 spikelets, axes terminating well beyond the terminal spikelets, apex entire, disarticulation at the base of the branches. Spikelets 5-6.5 mm long, with 1 bisexual and 1 sterile floret, appressed, all alike, green, laterally compressed; glumes unequal, shorter and thinner than the spikelet, membranous, 1-keeled, 1-veined, lateral veins absent, apex acuminate, lower glume 3–5 mm long, upper glumes 4–6 mm long, glabrous, sometimes scabrous; lemma of bisexual florets 5-6.5 mm long, glabrous, coriaceous, keeled, 3-veined, acute, 3-awned, awns less than 1 mm long, central awns 0.5-1 mm long, not flanked by 2 membranous lobes; anthers 2.2-3.7 mm long, dark purple; rudimentary florets sterile, usually without paleas; lemmas reduced to a glabrous awn column, sometimes moderately well-developed and 3-awned, awns usually not exserted, central awns 2.5-4 mm long. Caryopsis 3.2–3.6 mm long, ovoid. 2n = 21, 22, 23, 24, 25, 28, 38, 40.

This species frequently grows and may hybridize with B. curtipendula var. caespitosa.

DISTRIBUTION AND HABITAT. Bouteloua warnockii grows on limestone ledges and dry slopes below limestone outcrops. Its range extends from the southwestern United States to the states of Coahuila and Chihuahua in Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Manuel Benavides: Rancho Los Pinos, Sierra Rica, 21 Nov 2013, 29.17006°N, 104.04964°W, matorral desértico con [desert scrub with] *Yucca carnerosana, Mortonia semprevirens, Bouteloua curtipendula, Ephedra trifurca, Flourencia cernua,* and *Acacia constricta*, 1500–1800 m, *A. Juárez* 102 (CIIDIR, RELC).

68. Bouteloua williamsii Swallen, Ceiba 4(5): 285. 1955.

Perennial; caespitose, not rhizomatous. Culms 35–90(115) cm tall, slender, erect. Leaves basal; sheaths glabrous to hirsute; ligules 0.2-0.5 mm long, a delicate row of hairs; blades 10-25(35) cm long, 1.5-3 mm wide, flat, harsh leaves to the tact, abundantly haired, hairs 2-5 mm. Inflorescence 8-20 cm long, solitary, terminal. Spikes 5-11, 2-5(7) cm long, erect or spreading, deciduous when mature, bearing (9)12-20 spikelets, rachis flat, scabrous, with a tuft of hairs at the base of the spikelet. Spikelets 5-9 mm long, congested, persistent on each spike; glumes unequal, wide, acute or acuminate, with purple spots, lower glumes 3-4.5 mm long, slender, almost translucid, upper glumes 4.2-6 mm long; lemma of bisexual florets 4-6(7.5) mm long, firm, lateral veins excurrent into 2 awns of 2-3 mm long, central vein into a longer awn, with a truft of hairs at the base; palea apex 2-toothed, slightly longer than lemma, pubescent between the veins; anthers 2-3 mm long, yellow; rudimentary florets 1(2), staminate, lemma of the rudimentary florets 3-4 mm long, glabrous, with a tuft of silky hairs at the base, with 3 awns of 4-6 mm long, strongly flattened at the base, rachilla prolonged, the second rudimentary floret small when present. Caryopsis 3–4 mm long, straw-colored, ovoid to narrowly elliptic. 2n = 20.

This species is easily confused with *B. radicosa*, which differs in its lack of rhizomes, leaves that are harsh to touch, and longer spikes with a larger number of spikelets.

DISTRIBUTION AND HABITAT. *Bouteloua william-sii* grows in dry soils of the oak forests, grasslands, and subtropical scrub. It is found from Mexico to Honduras.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ignacio Zaraza: 20.3 km NE of Ignacio Zaragoza on Mex 23, 28 Sep 1989, 2400 m, *P.M. Peterson & R.M. King* 8149 (US).

Bromus L.

Perennial, annual, or biennial; usually caespitose, occasionally rhizomatous. Culms 5–150 cm tall, 1 to several per plant. Sheaths closed to near the top, glabrous to pubescent; auricles present to usually absent; ligules to 7 mm long, membranous, usually erose or lacerate; blades generally flat, rarely involute,

glabrous or pubescent. Inflorescences panicles, sometimes racemose, open to dense, erect to nodding. Spikelets 1.3–4 cm long, terete to laterally compressed; disarticulation above the glumes and beneath the florets. Glumes unequal, shorter than the adjacent lemmas, glabrous or pubescent, usually acute, rarely mucronate; lower glumes 1- to 7(9)-veined; upper glumes 3- to 9(11)-veined; lemmas rounded to keeled, glabrous or pubescent, 5- to 13-veined, apex entire, emarginate, or toothed, usually

terminally or subterminally awned, sometimes unawned; paleas usually shorter than lemmas, ciliate on the keels, adnate to the caryopsis; anthers 2–3. Caryopses somewhat ellipsoid, dorsally flattened (section Bromus) to terete and laterally compressed (section Ceratochloa). x = 7.

Bromus grows in temperate and cool regions, and is estimated to include 165 species (Saarela et al., 2014; Soreng et al., 2017b).

KEY TO SPECIES OF BROMUS

- 1. Spikelets strongly laterally compressed; lemmas strongly keeled; upper glumes 5 or more veined. 2. Lemmas unawned or with awns up to 3 mm long; upper glumes 9(11)-veined; lemma veins usually raised B. catharticus 1. Spikelets not strongly laterally compressed; lemmas rounded on the mid-rib; upper glumes 1- to 3-veined. 3. Lemma apex conspicuously bidentate, the teeth hyaline, awnlike to acuminate; largest lemmas generally less than 2 mm 3. Lemma apex entire or inconspicuously bidentate, the teeth usualy not hyaline; largest lemma generally greater than 2 mm wide. 4. Plants perennial; lower glumes 1(3)-veined; upper glumes 3(5)-veined. 5. Most lower glumes 1-veined. 6. Sheath auricles usually present; ligules 0.2-1.6 mm long; leaf blades 2-4 mm wide; lemmas 7-10 mm long; 6. Sheath auricles absent; ligules 1.5-4 mm long; leaf blades (3)4-10(13) mm wide; lemmas (9)10-13.5(15) mm 5. Most lower glumes 3-veined. 7. Sheath auricles absent; spikelets 2–3 cm long; lemma pubescent over the back or sometimes on the margins only, 7. Sheath auricles present at least on the lower leaves; spikelets 1.5–3 cm long; lemma pubescent all over the back
- Bromus anomalus Rupr. ex E. Fourn., Mexic. Pl. 2: 126.
 1886.

FIGURE 56

Perennial; not rhizomatous. Culms up to 110 cm tall, 2-4 mm thick, erect or ascending, bases often weakly to strongly decumbent, glabrous, scabrous or pubescent. Sheaths glabrous, pubescent, or pilose, hairs to 1.5 mm long, midrib distinctly narrowing below the collar; auricles usually present on the lower leaves, sometimes absent; ligules to 0.2-1.6 mm long, glabrous, erose-lacerate, ciliate; blades up to 35 cm long, 2-4 mm wide, flat, glabrous or weakly to moderate pubescent or pilose in both sides, hairs up to 1 mm. Panicles 10-18 cm long, open, nodding; branches ascending or spreading, scabrous, 1-5 spikelets per branch. Spikelets 1.5-2.8 cm long, 4- to 12-flowered, elliptic to lanceolate, terete to moderately laterally compressed; glumes usually pubescent, hairs up to 0.4 mm long, occasionally glabrous to puberulent, margins hyaline, green, purplish-green to purple along and between the veins; lower glumes 5-7.5(8.5) mm long, triangular or narrowly lanceolate, 1- or 3-veined; upper glumes 6-10.5 mm long, obovate-lanceolate, 3-veined, apex obtuse, acute or mucronate, mucros up to 0.6 mm; lemmas 7–10 mm long, elliptic to lanceolate, rounded over the back, 5- to 7-veined, backs and margins pubescent, apex acute, obtuse or truncate, entire; awns 1.2–3 mm long, straight, arising less than 0.5 mm below the lemma apex, straight; paleas shorter and narrower than the lemmas, backs glabrous or pubescent, keels ciliate, cilia to 0.2 mm; anthers 1.5–3.2 mm long. Caryopsis 5–9 mm long, light brown, 2n = 14.

This species is used by the Tarahumara (who refer to themselves as the Raramuri) people in the Sierra Madre Occidental (at Guachochi) to inoculate *tesquino* (sacred corn beer) and start the fermentation process by first chewing *Bromus anomalus* and then expectorating into a vat of corn mash. Author PMP was accompanied by G. A. Palma Aguirre and J. A. Bustillos Ramirez (two Raramuri) to a site at the edge of the Barranca Rio Verde (*Peterson et al.* 15372) to obtain a sample of this species.

DISTRIBUTION AND HABITAT. *Bromus anomalus* is a common native species that occurs in the mountains in pine–oak forests, on slopes, at forest margins, along creeks, and in ravines at 1,800–2,500 m. It extends from western Texas to Mexico, Guatemala, and Costa Rica.

 Bromus carinatus Hook. & Arn., Bot. Beechey Voy. 403. 1840.

Plants short-lived perennial; not rhizomatous. Culms 50–150 cm tall, usually less than 3 mm thick, erect, glabrous to pubescent below inflorescences. Sheaths mostly glabrous or pubescent to soft pilose, hairs up to 2 mm long, throats glabrous or pubescent; auricles absent; ligules (1)2–3(4) mm long, glabrous or pubescent, lacerate or erose; blades 10–30 cm long, 3–6(11) mm wide, flat, glabrous or pubescent on 1 or both surfaces, midveins narrowing beneath the collar. Panicles 5–30 cm long, open, branches erect, ascending or spreading, 4–22 cm long, pedicels longer or shorter than spikelets, glabrous, scabrous or pubescent, 1–4(9) spikelets per branch. Spikelets 2–4 cm long, 4- to 11-flowered, elliptic to lanceolate, strongly laterally compressed; glumes glabrous or pubescent, green to purple along and between the veins, margins hyaline; lower glumes 6.5–12 mm long, lanceolate, 3- to 7-veined, apex acute; upper glumes 9–15 mm

long, shorter than the lowest lemma, obovate-lanceolate, 5- to 9-veined, apex acute to acuminate; lemma 11-20 mm long, lanceolate, laterally compressed, strongly keeled distally, apex acute to obtuse, 7- to 9-veined, veins usually not raised or riblike, glabrous, scabrous, or pubescent, hairs sometimes restricted to margins, hairs up to 0.5 mm; awns 2-15 mm long, inserted 0-0.5 mm below the lemma apex, straight; paleas shorter than the lemmas, backs glabrous or pubescent, keels ciliate, cilia to 0.2 mm long; anthers 0.5-4.5 mm long. Caryopsis 9-11 mm long, 2n = 56.

DISTRIBUTION AND HABITAT. Bromus carinatus is native from British Columbia to Saskatchewan and south to Mexico and Central America. Widespread in the pine forests of Mexico, in meadows, pastures, canyons, and on slopes at 1,500–3,200 m.

The great variation of this species in Mexico and Central America is discussed in Saarela et al. (2014), who recognized two varieties as follows (Barkworth et al., 2006).

KEY TO VARIETIES OF BROMUS CARINATUS

 1. Most awns greater than 7 mm long
 B. carinatus var. carinatus

 1. Most awns less than 7 mm long
 B. carinatus var. marginatus

Bromus carinatus var. carinatus.

Awns 7.1–10 mm long.

DISTRIBUTION. This variety is not as widespread as var. *marginatus*. It is known from Costa Rica, Honduras, and Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: ejido San Ignacio Arareco, 19 Oct 1973, pine–oak forest, 7300 ft, *Bye 5478* (MEXU). Guerrero (San Ignacio): a 2 km al S del poblado del mismo nombre [village of the same name], Rancho Escuela de la Univ. Autónoma de Cd. Juárez, 18 Mar 1995, 1090 m, R. Corral, P. Olivas & E. Pérez RCD6030 (UACJ). Temosachi: Yepáchic, 3 Sep 1971, grows in profusion in abandoned fields near Yepáchic, 2100 m, C. W. Pennington 4 (MEXU).

71. Bromus catharticus* Vahl, Symb. Bot. 2: 22. 1791.

FIGURE 57

Annual, biennial, or short-lived perennial; not rhizomatous. Culms 20-120 cm tall, 2-4 mm thick, erect or decumbent, glabrous below inflorescences. Sheaths pubescent or pilose, hairs up to 1.2 mm; auricles absent; ligules 2-5(6) mm long, glabrous or pubescent, lacerate; blades 4-30 cm long, 2-10 mm wide, flat, sometimes conduplicate, glabrous to pubescent on 1 or both surfaces. Panicles 8-30 cm long, usually open, nodding, branches erect to ascending, scabrous, up to 5 spikelets per branch. Spikelets 1.5-3(3.5) cm long, elliptic to lanceolate, 4- to 11-flowered, strongly laterally compressed; glumes glabrous, scabrous, or pubescent, green to purplish-green along and between the veins, margins hyaline, midveins glabrous to scabrous distally, apex acute to obtuse; lower glumes 6-12 mm long, lanceolate, 3- to 7-veined; upper glumes 8-14 mm long, ovate-lanceolate, 9(11)-veined, shorter than the lowest lemma; lemmas 10-20 mm long, obovate-lanceolate, strongly keeled, apex acute to obtuse, 7- to 11-veined, veins usually raised and riblike, green, greenishyellow or purplish-green along and between the veins, glabrous or scabrous, margins hyaline; awns 0.5-3.5(4) mm long, inserted up to 0.5 mm below lemma apex, straight; paleas shorter than the lemmas, backs glabrous, strongly keeled; anthers 0.5-1.3 mm long; caryopsis 8–10 mm long, light brown. 2n = 42.

DISTRIBUTION AND HABITAT. Bromus catharticus is native to South America. It has been widely introduced in the southern United States and Mexico. It usually grows on disturbed habitats at 2,200–2,600 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Casas Grandes: camino [road] al Willis rancho Mesa de la Avena, 29 May 1981, bosque esclero-aciculifolio [narrow-leaved sclero-phyllous forest], 2570 m, *R. Fierros* 1270 (MEXU).

glabrous, sometimes pubescent, hairs up to 1 mm. Panicles 9-13 cm long, 3-6 cm wide, open, nodding, branches ascending to spreading, 0.5-5 cm long, shorter or longer than spikelets, scabrous, 1–4 spikelets per branch. Spikelets 1.6–3 cm long, 7- to 9 flowered, elliptic to lanceolate, terete to moderately laterally compressed; glumes green along and between the veins, glabrous, scabrous or minutely pubescent, hairs when present sometimes restricted to the hyaline margins; lower glumes 6-8.5 mm long, 0.6-1 mm wide, lanceolate, 3-veined, apex acute; upper glumes 8-10 mm long, 0.9-1.3 mm wide, oblong-ovate, 3-veined, apex acute or mucronate, mucros up to 1 mm; lemmas 9-12 mm long, 1.5-2.5 mm wide, elliptic to lanceolate, rounded over the backs, apex truncate, 5- to 7-veined, green along and between the veins, backs glabrous or sparsely to densely pubescent, margins pubescent on the lower 1/3 to 1/2, hairs up to 1 mm long; awns 3.5-6 mm long, straight, arising 0-0.5 mm below lemma apex, straight; paleas shorter than the lemmas, 9–10 mm long, backs glabrous or pubescent: anthers 1.5-3.5 mm long. Caryopsis 6–8 mm long. 2n = 14.

DISTRIBUTION AND HABITAT. Bromus frondosus is native and grows in open woods and on rocky slopes associated with pine forests at 1,300–2,750 m. Its range extends from Colorado, Arizona, and New Mexico into northern Mexico.

FIGURE 59

Annual. Culms (22)30-70 cm tall, erect or ascending. Sheaths usually densely pilose; upper sheaths sometimes pubescent or glabrous; ligules 1-2.2 mm long, pilose, obtuse, lacerate; blades 10-20 cm long, 2-4 mm wide, usually pilose on both surfaces. Panicles 10–22 cm long, 4–13 cm wide, open, nodding; branches usually longer than the spikelets, spreading to ascending, slender, flexuous, somewhat drooping, sometimes sinuous, often with more than 1 spikelet. Spikelets 20-40 mm long, lanceolate, terete to moderately laterally compressed; florets 6–12, bases concealed at maturity; rachilla internodes concealed at maturity; glumes smooth or scabrous; lower glumes 4.5-7 mm long, 3- to 5(7)-veined; upper glumes 5-8 mm long, 7- to 9-veined; lemmas 7–9 mm long, 1.2–2.2 mm wide, lanceolate, coriaceous, smooth proximally, scabrous on the distal ½, obscurely (7)9-veined, rounded over the midvein, margins hyaline, 0.3-0.6 mm wide, obtusely angled above the middle, not inrolled at maturity, apex acute, bifid, teeth shorter than 1 mm; awns 8-13 mm long, strongly divergent at maturity, sometimes straight, twisted, flattened at the base, arising 1.5 mm or more below the lemma apex; anthers 1-1.5 mm long. Caryopsis equaling or shorter than the paleas, thin, weakly inrolled or flat. 2n = 14.

DISTRIBUTION AND HABITAT. *Bromus japonicus* grows in fields, waste places, and roadways. It is native to central and southeastern Europe and Asia and is distributed throughout much of the United States and southern Canada with one record from the Yukon Territory.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Rancho Experimental La Campana, Chihuahua, 14 May 1977, 1540 m, *S. González 838* (ENCB); Rancho

74. Bromus richardsonii Link, Hort. Berol. 2: 281. 1833. Bromus mucroglumis Wagnon.

FIGURE 60

Perennial; not rhizomatous. Culms 50-110(145) cm tall, erect to spreading; nodes (3)4-5(6), usually glabrous, sometimes pubescent; internodes usually glabrous. Basal sheaths often retrorsely pilose; culm sheaths glabrous, often tufted-pilose near the auricle position, midrib of the culm leaves not abruptly narrowed just below the collar; auricles absent; ligules 0.4-2 mm long, glabrous, rounded, erose, ciliolate; blades 10-35 cm long, 3–12 mm wide, flat, glabrous. Panicles 10–20(25) cm long, open, nodding; branches ascending to spreading or drooping, filiform. Spikelets 15-25(40) mm long, elliptic to lanceolate, terete to moderately laterally compressed, with (4)6-10(15) florets; glumes usually glabrous, sometimes pubescent; lower glumes 7.5-12.5 mm long, 1(3)-veined; upper glumes 8.9-11.3 mm long, 3-veined, often mucronate; lemmas 9-14(16) mm long, elliptic, rounded over the midvein, margins more or less densely pilose on the lower ½ or ¾, lower lemmas in a spikelet glabrous across the back, uppermost lemmas with appressed hairs on the back, apex obtuse, entire; awns (2)3-5 mm long, straight, arising less than 1.5 mm below the lemma apex; anthers 1.6-2.7 mm long. 2n = 28.

DISTRIBUTION AND HABITAT. Bromus richardsonii grows in meadows and open woods in the upper montane and subalpine zones at about 2,000–4,000 m in the southern Rocky Mountains and at lower elevations northward. Its range extends from southern Alaska to southern California and northern Baja California, Mexico. Bromus ciliatus L., sometimes assigned as occurring in Mexico (Soderstrom and Beaman 1968), is distributed across southern Canada and the United States, except the south-central and southeastern United States (Pavlick and Anderton 2007); it is not known from Mexico (Saarela et al., 2014).

75. Bromus tectorum* L., Sp. Pl. 1: 77. 1753.

FIGURE 61

Plants annual. Culms 5–80 cm tall, solitary or loosely tufted, erect or ascending, nodes, as well as below infloresences, glabrous or minutely pubescent. Sheaths glabrous or variously pubescent, hairs stiff and up to 0.5 mm or soft and wavy up to 1 mm long; ligules (1)2–3 mm long, erose-lacerate; blades 1.3–1.4 cm long, 1–5 mm wide, flat, sparsely to densely pubescent adaxially, puberulent abaxially. Panicles 4–22 cm long, 1-13.5 cm

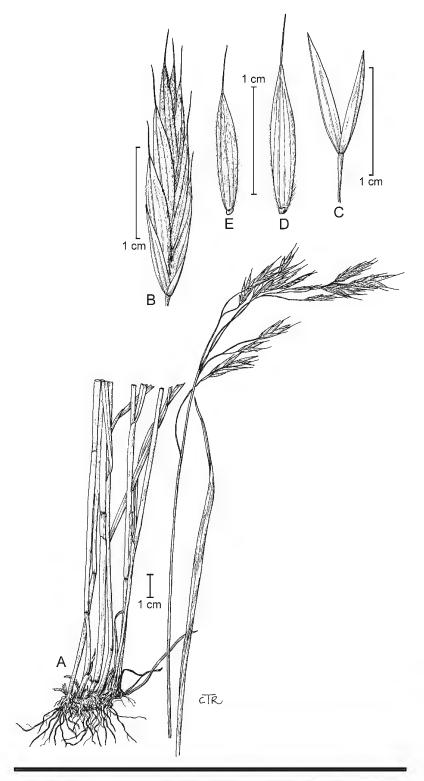

FIGURE 60. *Bromus richardsonii*. A. Habit. B. Spikelet. C. Glumes. D. Lower lemma. E. Upper lemma. Drawn by Cindy Roché; copyright Utah State University.

wide, condensed and erect when young, becoming lax and nodding, sometimes reduced to a few spikelets, branches spreading to drooping, 0.4-4 cm long, usually longer than spikelets, 1-sided, often sinuous, scabrous to densely pubescent, 1-14 spikelets per branch. Spikelets 1.5-2(2.5) cm long (2.5-3.5 cm including awns), 3- to 6(8)-flowered, linear-elliptic to cuneate, moderately laterally compressed, rachilla sometimes visible at maturity; glumes green to purplish-green, glabrous or minutely pubescent in a line inside the hyaline margins, the apex bifid, the cleft 0.1-0.5 mm deep; lower glumes 4-9 mm long, linearlanceolate, 1(3)-veined, occasionally minutely awned, awn to 1.1 mm long, upper glumes 7–13.5 mm long, elliptic-lanceolate, 3(5)-veined, lanceolate, awned; lemma 9-13.5 mm long, lanceolate, rounded over the backs, 7-veined, apex bifid, the teeth 1-3 mm long, awn 8-18 mm long, arising 1-2.5 mm below the lemma apex, straight; palea 7-8.7 mm long, back glabrous and keels ciliate; anthers 0.5–0.9 mm long. Caryopsis 7–8 mm long. 2n = 14.

DISTRIBUTION AND HABITAT. Bromus tectorum was introduced to Mexico; it grows in arroyos and meadows in conifer forests. It is common in northern Baja California, and a few other collections are from cultivated gardens in Chihuahua, Coahuila, and Sonora; apparently it has not spread from there.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Maleza en jardín de observación [weed in oberservation garden] en el Rancho Experimental La Campana, 12 Apr 1975, Valdés-Reyna VR877 (RELC).

Calamagrostis Adans.

Plants rough, perennial; caespitose or rhizomatoses. Culms simple, slender; ligule a membrane; blades linear, firm, flat or involute. Inflorescence a terminal panicle, spread or contracted. Spikelets lateraly compressed, 1 floret or rarely 2 florets, disarticulating above the glumes; glumes longer than the florets, equal or subequal, acute or acuminate, 1- to 3-veined; lemma generally 5-veined, membranous, the apex truncate to 2-toothed or shortly 4-awned, awn emerging from the back, the awn straight or geniculate, often twisted, insert near the base; callus obtuse, rarely recurved or elongated, generally pilose, the pubescence can be very short to long and copious; palea slender, shorter than the lemma; rachilla prolongate behind the palea as a naked bristle or pilose; stamens 1–3. Caryopsis with solid endosperms, often liquid or soft. x = 7.

Calamagrostis has approximatelly 150 species of temperate and cold regions of the world.

 Calamagrostis pringlei Scribn. ex Beal, Grass. N. Amer. 2: 345. 1896.

Perennial; rhizomatous. Culms 50–70(80) cm tall, solitary or mat-forming, erect, glabrous, rhizomes crawling. Sheaths glabrous to sparsely pilous or scabrous when young; ligules 1–4 mm

long, membranous, irregularly toothed; blades 10–15 cm long, 1–4 mm wide, flat, involute when dry, pilose in both surfaces. Panicles 6–18 cm long, narrow, sometimes nodding; branches ascending, naked near base or with spiklets at the base, green with pinkish spots, axis glabrous or scaberulous, capillary; glumes 4.5–5 mm long, narrow subequal, acuminate, 1-veined, scabrous; lemma 4.5–5 mm long, soft and scaberulous, almost acuminate, awn 4–6 mm long, slender, geniculate, frequently twisted on the base, scabrous distally, exserted; callus with hairs 0.8–1 mm long; rachilla 1.5–2 mm long, pubescent, the hairs 1–2 mm long.

DISTRIBUTION AND HABITAT. Calamagrostis pringlei grows in oak forests and rocky cliffs with Pinus, Pseudotsuga menziesii (Mirb.) Franco, Cupressus, Arctostaphylos pungens Kunth, and Brickellia; it occurs in Aguascalientes, Chihuahua, Coahuila, Durango, Hidalgo, Michoacán, Nuevo León, and Zacatecas.

Cenchrus L.

Annual or perennial. Culms 5-200 cm tall, erect or decumbent, usually geniculate; nodes and internodes usually glabrous. Sheaths open, usually glabrous; ligules membranous, ciliate, cilia as long as or longer than the basal membrane; blades flat or folded, margins cartilaginous, scaberulous. Inflorescences terminal, spikelike panicles of highly reduced branches termed involucres ("burs"); involucres consisting of 1–2 series of many, stiff, partially fused, usually retrorsely scaberulous to strigose, sharp bristles surrounding, sometimes almost concealing, 1-4 spikelets; outer (lower) bristles, if present, in 1 or more whorls, terete or flattened; inner (upper) bristles usually strongly flattened, fused at least at the base and forming a disk, frequently to more than ½ their length and forming a cupule; disarticulation at the base of the involucres. Spikelets sessile, with 2 florets; lower florets usually sterile; upper florets bisexual. Lower glumes ovate, scarious, glabrous, 1-veined, acute to acuminate; upper glumes and lower lemmas ovate, 3- to 9-veined; lower paleas equaling the lemmas, tawny or purplish; upper lemmas and paleas subequal, indurate, ovate, obscurely veined, acuminate. Caryopsis obtrulloid. x = 17.

Cenchrus, as now circumscribed (synonym = *Pennisetum* Rich.), includes about 120 primarily tropical species, some of which are readily (and painfully) recognized by their spiny involucres (Soreng et al., 2017b). Many species in Mexico are considered to be undesirable weeds.

KEY TO SPECIES OF CENCHRUS

- 1. Involucres of spines or stiff bristles united at the base or halfway to the apex, usually retrorse roughened, the early ones antrorse scabrous.
 - 2. Spines or bristles united only below the inferior ½ (almost at the base), forming a soft involucre, ciliate or feathery, not spinose, with a small disk and forming a low, deep cupule; perennial.

 - 3. Bristles antrorsely bearded.

 - 4. Bristles somewhat indurate (especially the innermost ones), sparsely pilose but never feathery, the innermost ones 2 or more times longer than the rest; spikelets 5–6(9) mm long; inflorescences 1–1.5 cm wide C. multiflorus
 - 2. Spines or bristles united more or less halfway, forming a hardened involucre; annual and/or biannual.
- 1. Involucres of free bristles (or somewhat united at the base), often feathery.

 - 6. Plants not stoloniferous; culms erect, 30–300 cm tall; panicles terminal or terminal and axillary, fully exserted at maturity, the rachises terete, with 10 to many involucres; spikelets 2.5–12 mm long, the majority of the bristles as long as or longer than the spikelets.

 - 7. Inflorescences 3–15 mm wide; bristles ciliate, glabrous or scabrous.

 - 8. Perennial plants; caryopsis elliptsoid, permanently hidden by the lemma and palea; blades 20–60 cm long, never cordate at the base.
- 77. Cenchrus americanus* (L.) Morrone, Ann. Bot. (Oxford), n.s. 106: 127.

Pennisetum glaucum (L.) R. Br.

FIGURE 62

Annual. Culms 150-300 cm tall, erect, robust, branching; nodes bearded. Sheaths glabrous or pubescent; ligules 2-5 mm long, a fringe of hairs; blades 50-100 cm long, 8-70 mm wide, cordate on the base, flat. Inflorescence a spiciform panicle, terminal, 4-200 cm long, 8-60 mm wide, fully exserted from the sheaths, erect; rachises terete, densely pubescent. Involucres 33-160 per cm; involucre axes 1–28 mm long, persistent, with 1–9 spikelets; outer bristles 44-131, 0.5-6 mm; inner bristles 6-19, 4-6 mm long, plumose; primary bristles 5.5-6.3 long, ciliate, sometimes noticeably longer than the other bristles. Spikelets 3-6 mm long; pedicels 0.6-1.8 mm long; lower glumes absent or to 1.5 mm long, veinless; upper glumes 0.5-2.5 mm long, 3- to 5-veined; lower florets staminate or sterile; lower lemmas 1.5-6 mm long, glabrous, 3- to 7-veined, margins ciliate; lower paleas vestigial or fully developed, margins ciliate; anthers 2.2-2.5 mm long, penicillate; upper florets coriaceous, shiny; upper lemmas 4.3–7 mm long, 5- to 7(9)-veined, margins ciliate; upper paleas 3.4–3.9 mm long, pubescent, at least near the base, margins ciliate; anthers 2–2.2 mm long, penicillate. Caryopsis 2–5.5 mm long, 1.6–3.2 mm wide, obovoid, exposed between gaping lemma and palea at maturity. 2n = 14.

DISTRIBUTION AND HABITAT. *Cenchrus americanus*, a native of Asia, is cultivated in the United States for grain, forage, and birdseed; reported wild from Chihuahua, Mexico but not seen.

78. Cenchrus ciliaris* L., Mant. Pl. 302. 1771. Pennisetum ciliare (L.) Link, Hort. Berol. 1: 213 1827.

FIGURE 63

Perennial; emerging from a hard and nodose crown or short rhizomes. Culms 25–100 cm long, erect, branched, glabrous. Sheaths compressed, glabrous or pilose near the throat, margins hyaline; ligule 0.5–2.5 mm long, pilose; blades 3–24 cm long, 2–8 mm wide, flat, scabrous to pilose, narrowing toward the apex. Inflorescence 2–12 cm long, 1–2.5 cm wide, rachis flexible and scabrous, internodes 0.8–2 mm; involucres 9–15 mm

long, 3–4 mm wide, elongated, pubescent, pedicels small, pilose; straight spines or some curved, with long hairs, pubescent on the internal margins, united only basally or a little higher, antrorsely scabrous, the internal feathery; lower verticil of similar spines, similar to bristles, shorter than the internal spines. Spikelets 2–4 per involucre. Lower glumes 1–2.5 mm long, 1-veined, slender, membranous; upper glumes 1–3 mm long, 1- to 3-veined; inferior floret staminate; inferior lemma 2–4.5 mm long, 5- to 6-veined, inferior palea 2–4 mm long, partially covered by the lemma; superior florets bisexual, 2.2–5 mm long, 1–1.5 mm wide; anthers 2.4–2.6 mm long. Caryopsis 1.2–1.9 mm long, 0.4–1 mm wide. 2n = 45

DISTRIBUTION AND HABITAT. *Cenchrus ciliaris* is a weed native to Africa, western Asia, and India and grows along road margins and cultivated areas in desert scrub and disturbed tropical forests. It ranges from Canada, the United States, Mexico, Central and South America to the Caribbean Islands.

FIGURE 64

Perennial; rhizomatous and stoloniferous, mat-forming. Culms 3–45 cm tall, prostrate, highly rooting from lower nodes; nodes glabrous. Sheaths glabrous or pubescent; ligules 1.3–2.2 mm long; blades 1–15 cm long, 1–6 mm wide, flat or folded, glabrous or pubescent. Panicles 2–2.7 cm long, axillary, concealed in the sheaths; rachises flat, glabrous or scabrous. Involucres 1–6; axes to 0.5 mm long, with 1–2 spikelets; outer and inner bristles alike, 6–15, 0.5–10.9 mm; primary bristles

10–14 mm long, usually not noticeably longer than the other bristles. Spikelets 10–22 mm long, sessile or pedicellate, pedicels to 0.2 mm; lower glumes usually absent, sometimes to 0.5 mm long, veinless; upper glumes 0–1.3(3.5) mm long, veinless; lower florets sterile; lower lemmas 10–22 mm long, 9- to 13-veined; lower paleas usually absent; upper lemmas 10–22 mm long, 8- to 12-veined; upper paleas 2- to 7-veined; anthers 4.7–7 mm long, long-exserted from the florets at anthesis. 2n = 36.

DISTRIBUTION AND HABITAT. *Cenchrus clande-stinus* is native to Africa. It now grows in many parts of the world, often as a forage or lawn grass.

SPECIMENS EXAMINED. MEXICO. Chihuahua. In all the towns and municipalities of the state it is cultivated in gardens of houses and buildings, but there are few herbarium specimens.

80. Cenchrus durus (Beal) Morrone, Ann. Bot. (Oxford), n.s. 106: 128. Pennisetum durum Beal, Grass. N. Amer. 2: 163. 1896.

Perennial. Culms 100-200 cm tall, erect, robust, rigid, glabrous, glaucous, solitary or grouped, from a hard, knotty base, branched on superior nodes, sligtly compressed. Sheaths glabrous or scabrous, pubescent on margins toward the apex, margin scarious, collar pubescent; ligules 1.5-2 mm long, densely ciliate; blades 20-60 cm long, 5-17 mm wide, ascending to divaricate, rigid, scaberulous or glabrous, largely apiculate, narrow on the base. Inflorescence a spike 3-10(12) cm long, 8-10 mm wide, terminal, rachis slender, narrow, scabrous, involucres sessile, ascending, bristles scarce, glabrous, unequal, shorter than spikelets, internal bristle longer, sometimes twice as long as spikelet. Spikelets 6-7 mm long, 1.5 mm wide, acuminate, glabrous, solitary, sessile; glumes unequal, obtuse to subacute, ciliolate, lowerglumes 2-2.3 mm long, 1- to 3-veined, upper glumes 3-3.5 mm long, 3- to 5-veined; lemma sterile 5.8-7 mm long, 5-veined, concave on the back, acute; palea reduced; lemma fertile 6-7 mm long, acuminate, scabriusculous especially on the apex; stigmas plumose, black. Caryopsis subhardened, acuminate.

DISTRIBUTION AND HABITAT. *Cenchrus durus* is an endemic Mexican species from Chihuahua and Oaxaca.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: entering Barranca El Cobre, 28.3 km S of Cusarare on road to Guachochi, 25 Sep 1988, 1900 m, P.M. 81. Cenchrus echinatus* L., Sp. Pl. 2: 1050. 1753.

FIGURE 65

Annual. Culms 20-100 cm tall, ascending from a geniculate base. Sheaths from shorter than to equaling the internodes, compressed; ligules 0.7-1.7 mm long; blades 4-18(35) cm long, 2-10(14.2) mm wide, adaxial surfaces sparsely pilose, hairs papillose-based. Panicles 2.5-12 cm long; rachis internodes 2-4 mm long; involucres 5-10 mm long, 3.5-6(6.3) mm wide, imbricate; outer bristles 10-20, terete, the majority no more than ½ as long as the inner bristles; inner bristles 2–5 mm long, 0.6– 1.5 mm wide, flattened, not grooved, mostly erect, fused for at least ½ their length into a globose cupule, sometimes interlocking at maturity, shortly pubescent, often purple at maturity. Spikelets 2-3(4) per involucre (fascicle), 4.8-7 mm; lower glumes 1.3-3.4 mm long; upper glumes 3.8–5.7 mm long, 3- to 7-veined; lower lemmas 4.5-6.5 mm long; upper florets 4.7-7 mm long; anthers 0.8-2.4 mm long. Caryopsis ovoid, 1.2-3.2 mm long, 1.3-2.2 mm wide. 2n = (34), 68.

DISTRIBUTION AND HABITAT. Cenchrus echinatus grows in disturbed areas throughout the coastal plain and piedmont of the southern United States, Mexico, Central and South America, and as an unwelcome introduction elsewhere. Widely distributed; however there are few specimens in herbaria.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: SW of Chihuahua, Aug-Nov 1885, E. Palmer 22 (US).

82. *Cenchrus michoacanus* H. F. Gut & Morrone, Bol. Soc. Argent. Bot. 47(1–2): 268. 2012.

Pennisetum crinitum (Kunth) Spreng.

Perennial; caespitose. Culms 150-250 cm tall, 6-10 mm thick, erect, branched, glabrous, internodes solid. Leaves glabrous; sheaths, some carinate, short; ligules 0.5-1.3 mm long, a pilose membrane, blades 20-40 cm long, 8-18 mm wide, flat, thick, sligtly wider toward the base, never cordate. Inflorescence 12-18 cm long, 10-15 mm wide, solitary, terminal, spikate, straw color or dark green, rachis striate, scabrous, straight or curved, involucres with 1 spikelet, sessile, bristles almost 30, mostly longer than spikelets, 5-8 mm long, scabrous, internal bristles 12-20 mm. Spikelets 5-6 mm long, acuminate, lower glumes 1.5-2.5 mm long, 1-veined, subacute to acute, upper glumes 0.5-0.7 mm shorter than the spikelet, 5-veined, acute or acuminate; inferior floret sterile, inferior lemma as long as the spikelet, 5-veined; inferior palea missing; superior lemmas 4.5-5.4 mm long, chartaceous toward the base, apically membranaceous, glabrous; anthers 1.9-2 mm long, glabrous. Caryopsis 0.5–1.5 mm long, elliptic.

DISTRIBUTION AND HABITAT. Cenchrus micho-acanus grows in abandoned fields and grasslands with thorny

scrubs. It is a Mexican species from Chiapas, Guanajuato, México, and Michoacán.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Delicias: approx. 3 mi S of Delicias on Mex 45, 30 Mar 1971, 4200 ft, W.E. Harmon S-375 (ENCB). Julimes: Potrero Mts, 12 Oct 1886, C.G. Pringle 817 (US), Isotype.

Cenchrus multiflorus J. Presl, Reliq. Haenk. 1(4–5): 318. 1830.

Perennial; caespitose, base with scaly buds. Culms 50–160 cm tall, erect, simple or scarcely branched, glabrous or pilose. Sheaths sparsely carinate, glabrous to papillose-pilose; ligule 1.3-1.8 mm; blades 20-45 cm long, 5-10(20) mm wide, scabrous to sometimes spread papillose-pilose adaxially. Inflorescence 5-10(18) cm long, 10-15 mm wide, involucres 7-12 mm long, 2.5-3.5 mm wide, external bristles free, cylindrical, antrorse scabrous, the internal ones only united at the base, cylindrical, spread to moderate pilose. Spikelets 5-6(9) mm long, 2-5 per involucre (fascicle); lower glumes 2.2-2.9 mm long, 1-veined; upper glumes 3-5.2 mm long, 3- to 5-veined; inferior florets staminate, lemma of the inferior floret as long as the spikelet, 5- to 7-veined, paleas equal to lemmas or a little shorter; upper florets 5.2-6.6 mm long, 1-1.5 mm wide; anthers 1.9-3 mm long, 2n=34.

DISTRIBUTION AND HABITAT. Cenchrus multiflorus grows in deciduous tropical forests at 1,250–1,750 m; it is a Mexican species from Chiapas, Chihuahua, Durango, Guerrero, Jalisco, Oaxaca, and Zacatecas.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Vicinity of Areponapuchic, slopes of Barranca de Urique, Aug 1954, *I. Knobloch 1363* (US). Bocoyna: entre [between] Barranca del Cobre & Bacahipare, 17 Aug 1976, 1160–1640 m, *S. González 738* (ENCB, RELC). 84. *Cenchrus myosuroides* Kunth, Nov. Gen. Sp. (quarto ed.) 1: 115–116, t. 35. 1815.

FIGURE 66

Perennial. Culms 5–200 cm long, stout, glaucous. Sheaths from shorter than to equaling the internodes; ligules 1.5–2(3.4) mm long; blades 12–40 cm long, 4–13 mm wide, glabrous or sparsely pilose adaxially. Panicles 4–23 cm; involucres 3.8–8 mm long, 1.2–2.6 mm wide, composed of several whorls of bristles, not bur-like; bristles 3–5.8 mm long, 0.2–0.6 mm wide, fused only at the base, not forming a cupule, terete, increasing in size inward, inner bristles pubescent on the lower $\frac{1}{2}$ – $\frac{2}{3}$. Spikelets 3.8–4.8(5.6) mm long, 1(2–3) per involucre (fascicle); lower glumes 1.5–3 mm long; upper glumes 3–5 mm long, 3- to 5-veined; lower lemmas 3–5.5 mm long; upper lemmas 3.8–5.4 mm long; anthers 0.8–2.2 mm long. Caryopsis 1.5–2.6 mm long, 1–1.5 mm wide, ovoid. 2n = (54), 70.

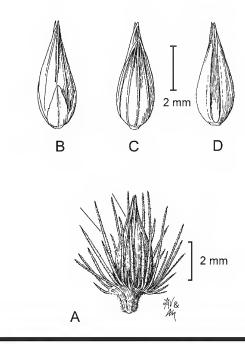

FIGURE 66. Cenchrus myosuroides. A. Involucre (fascicle). B. Lower glume and lower lemma. C. Upper glume. D. Floret. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

DISTRIBUTION AND HABITAT. Cenchrus myosuroides grows mostly along roadsides and in other waste places. Its native range extends through the Caribbean and Central America to northern South America.

Cenchrus polystachios* (L.) Morrone, Ann. Bot. (Oxford),
 n.s. 106: 129. 2010. Pennisetum polystachion (L.) Schult.,
 Mant. 2: 146. 1824.

FIGURE 67

Annual or perennial; caespitose from a hard, knotty base. Culms 30–200 cm tall, erect, branching; nodes glabrous. Sheaths glabrous, margins ciliate; ligules 1.5-2.7 mm long; blades 15-55 cm long, 4-18 mm wide, flat, glabrous or pubescent. Panicles 10-25 cm long, 15-30 mm wide, terminal, fully exserted from the sheaths, erect to drooping, white, yellow, light brown, or pink to deep purple; rachises terete, scabrous. Involucres 33-45 per cm long, disarticulating at maturity; involucres axes 0.2–0.5 mm long, with 1 spikelet; outer bristles 13–30, 1.3-5 mm long, scabrous; inner bristles 6-14, 4.3-11.5 mm long, long-ciliate; primary bristles 14-25 mm long, long-ciliate, noticeably longer than the other bristles. Spikelets 3-4.5 mm long, sessile; lower glumes absent or to 2 mm long, veinless; upper glumes 3-4.5 mm long, glabrous, 5- to 7-veined, 3-lobed; lower florets sterile or staminate; lower lemmas 3-3.9 mm long, 5- to 7-veined, apex lobed; lower paleas 2.9-3.7 mm; anthers absent or 1.7-2 mm long; upper florets disarticulating at maturity; upper lemmas 1.7-3 mm long, coriaceous, shiny, 5-veined, apex ciliate; anthers 1.3–2.1 mm long. Caryopsis about 1.7 mm long, concealed by the lemma and palea at maturity. 2n = 18, 36, 45,48, 52, 53, 54, 56, 78.

DISTRIBUTION AND HABITAT. Cenchrus polystachios is a polymorphic, weedy African species that has become established in the tropics and subtropics; it is considered a noxious weed in North America. Wipff (2003) followed Brunken (1979a; 1979b) in recognizing two subspecies in the Flora of North America, and we concur. Ours is perennial, usually sparingly branched, and has involucres yellow, light brown, or purplish. We make a new combination for this taxon below.

Cenchrus polystachios subsp. setosum (Sw.) P. M. Peterson & Y. Herrera, comb. nov. Basionym: Cenchrus setosus Sw., Prodr. 26. 1788 ≡ Pennisetum polystachion subsp. setosus (Sw.) Brunken, Bot. J. Linn. Soc. 79: 63. 1979. Holotype: WEST INDIES (JAMAICA). O.P. Swartz s.n. (S S06-637 [image!]).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Delicias: approx. 3 mi S of Delicias on Mex 45, 30 Mar 1971, along railroad adjacent to and creosote flats, 4200 ft, W.E. Harmon & Dunn 5375 (ENCB); P. Gallian & B.J. Cox 394 (ENCB); B.J. Cox 2879 (ENCB).

86. Cenchrus spinifex Cav., Icon. 5: 38, t. 461. 1799. Cenchrus incertus M. A. Curtis.

FIGURE 68

Annual or biannual; caespitose. Culms 10-80 cm tall, ascending or erect, branched, forming big mats, scabrous.

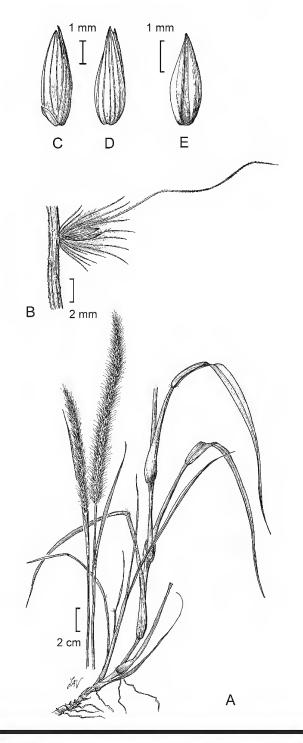

FIGURE 67. Cenchrus polystachios. A. Habit. B. Spikelet involucre. C. Spikelet showing lower glume on left. D. Spikelet showing upper glume. E. Upper lemma. Drawn by Linda Ann Vorobik; copyright Utah State University.

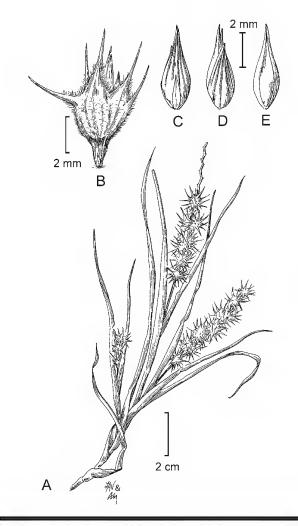

FIGURE 68. Cenchrus spinifex. A. Habit. B. Involucre (fascicle). C. Lower glume. D. Upper glume. E. Floret. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

Sheaths carinate, glabrous to pubescent along the margins; ligule 1–1.5 mm long, pilose; blades 3–10 cm long, 2–6 mm wide, flat to sometimes subinvolute. Inflorescence 2–8.5 mm long, 0.8–2 cm wide, with variable numbers of fascicles, the axis slender flexuous, scabrous or pilose; involucres 5–10 mm long, 2.5–5.5 mm wide, ovoid or globose, densely pubescent, with 8–40 united thorns fused to ½ their length, extended or reflexed, wide at the base, the exterior cylindrical, the interior flattened, involucre body deeply notched on the external face. Spikelets 3.5–5.8 mm long, 2–4 per involucre (fascicle); lower glumes 1.5–3 mm long, 1-veined, upper glumes 2.8–5 mm long, 5- to 7-veined; inferior florets staminate, inferior lemma

3–5.8 mm long, 4- to 7-veined, inferior palea 3–5.8 mm long; superior florets bisexual, 3.4–6 mm long; anthers 0.5–2 mm long, 2n = 34.

DISTRIBUTION AND HABITAT. Cenchrus spinifex is a weed that grows in disturbed sites and wet areas in the subtropical and xerophilous scrub and grasslands at elevations of 1,250–2,200 m. It ranges from United States, Mexico, Caribbean, and Central America to South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 7.4 km W of Balleza on road to Guachochi, 18 Sep 1991, scrub lands, 1660 m, P.M. Peterson, Annable & Valdés-Reyna 10728 (CIIDIR, US). Chaetium Nees

Perennial; with flatted leaves and panicles narrow and dense. Spikelets with a fertile floret and another rudimentary, represented by a sterile lemma, pedicelled, dorsally compressed, the bearded base of the lower glumes attached to rachilla, forming a long callus, slender, at the point of disarticulation above the very oblique base of pedicel. Glumes narrow or wide, subequal, prolonged into long awns; lemma of the sterile floret shortly

awned or only mucronate; lemma of the fertile floret somewhat hardened, acuminate, mucronate or awned, the margins slender, flatened, not enclosing the paleas at the base.

Chaetium is a genus with three species, one distributed in Cuba, one from South America, and ours found in Mexico and Central America.

87. Chaetium bromoides (J. Presl) Benth. ex Hemsl., Biol. Cent.-Amer., Bot. 3: 503. 1885. Berchtoldia bromoides J. Presl, Reliq. Haenk. 1: 324, t. 43. 1830.

Perennial; with strong stolons at the base. Culms 35–100 cm tall, erect or ascending, simple or branched; internodes compressed, glabrous, nodes bearded. Sheaths keeled, glabrous, but densely silky-pubescent on margins; ligule 1–2 mm long, a row of cilia; blades 10–30 cm long, 3–7 mm wide, papillose-pilose, flat to folded, narrowed toward the apex. Panicle 10–23 cm long, 1–2 cm wide, erect, the axis and rachis scabrous, racemes erect, appressed. Spikelets 6–8 mm long excluding the awns, fusiform, greenish or purpurescent, with pedicels 2–3 mm long, antrorsely hispid with hairs 2–3.5 mm long; glumes 6–8 mm long, wide, 5- to 7-veined, scabrous, with purple spots, the awns 10–35 mm long, straight or slightly flexuous; lemma of the inferior florets 6–8 mm long, 3-veined; lemma of the superior floret 6–8 mm long, smooth, the awns 1.5–2 mm long; callus 1.5–2.5 mm long; anthers 1.2–1.5 mm long. 2n = 26.

DISTRIBUTION AND HABITAT. Chaetium bromoides grows in pine–oak forests in open or disturbed areas; it ranges from Mexico to Central America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Chihuahua, 1886, E. Palmer s.n. (US).

Chloris Sw.

Annual or perennial; rhizomatous, stoloniferous, or caespitose. Culms internodes pith-filled. Sheaths strongly keeled, glabrous, scabrous, or pubescent; ligules membranous, erose to lacerate, ciliate or absent; blades often with long, coarse hairs near the base of the adaxial surface and margins. Inflorescence terminal, panicles with (1)5-30 spikelike branches, these usually borne digitately, in 2 to several whorls, often with a few isolated branches below the primary whorl(s), all branches usually exceeding the upper leaves; branches with spikelets in 2 rows on 1 side of the branch axes. Spikelets solitary, sessile to pedicellate, laterally compressed, with 2–3(5) florets, usually only the lowest floret bisexual, rarely the lower 2 florets bisexual, remaining floret(s) sterile or staminate; florets laterally compressed or terete, cylindrical to obovoid, awned or unawned, sterile and staminate florets progressively reduced distally; disarticulation usually beneath the lowest floret in the spikelets, all florets falling as a unit. Glumes unequal, exceeded by the florets, lanceolate, acute to acuminate, unawned, occasionally awned, awns to 0.3 mm; calluses bearded; lemmas of bisexual florets 3-veined, marginal veins pubescent, midveins usually glabrous, sometimes scabrous, usually excurrent into awn, sometimes merely mucronate, lemma apex truncate or obtuse, entire or bilobed, lobes when present can be awn-tipped; paleas shorter than lemmas, 2-veined, veins scabrous; anthers 3; lodicules 2. Caryopsis ovoid, elliptic, or obovoid. x = (9)10.

As interpreted here, *Chloris* is a tropical to subtropical genus of about 55 species and is most abundant in the Southern Hemisphere (Peterson et al., 2015). Two species treated here are native and one is introduced.

KEY TO SPECIES OF CHLORIS

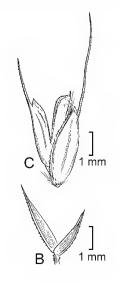

- 1. Fertile and rudimentary lemmas awnless or with a short mucro, less than 2 mm long, apiculate C. submutica
- 1. Fertile and rudimentary lemmas prominently awned, the awn more than 3 mm long.

88. Chloris gayana* Kunth, Révis. Gramin. 2: 293, t. 58. 1830.

FIGURE 69

Perennial; usually stoloniferous. Culms to 300 cm tall, erect. Sheaths glabrous or scabrous, often ciliate apically; ligules ciliate; blades to 30 cm long, 15 mm wide, scabrous. Panicles digitate, with 9–30 evidently distinct branches; branches 8–20 cm long, usually somewhat divaricate, spikelet-bearing to the base, averaging 10 spikelets per centimeter. Spikelets strongly imbricate, tawny, with 1 bisexual and (1)2–4 usually staminate, sometimes sterile, florets; lower glumes 1.4–2.8 mm long; upper glumes 2.2–3.5 mm long; lowest lemmas 2.5–4.2 mm long, 0.7–1 mm wide, ovate to obovate or elliptic, somewhat

gibbous, sides not grooved, pubescence variable, sides usually glabrous, sometimes scabrous or appressed-pubescent, margins usually glabrous or appressed-pubescent on the lower portions, sometimes throughout, sometimes with strongly divergent hairs distally, the hairs less than 1 mm long, oftern divergent, apex inconspicuously bilobed, awned, awns 1.5-6.5 mm long; second florets 2.2-3.2 mm long, 0.3-1 mm wide, staminate or sterile, similar to the first floret but more cylindrical, not widened distally, inflated, if at all, only near the apex, inconspicuously bilobed, awned, the awns 0.8-3.2 mm long; distal florets progressively smaller, longer than the subtending rachilla segment, awn-tipped or unawned. Caryopsis 1-1.5 mm long, about 0.5 mm wide. 2n = 20, 30, 40.

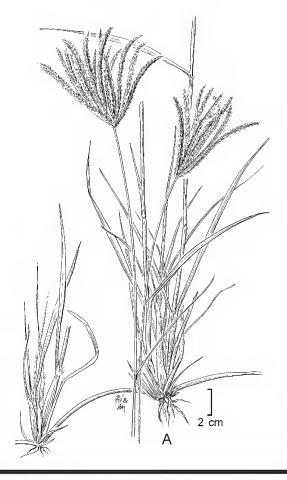

FIGURE 69. *Chloris gayana.* A. Habit. B. Glumes. C. Florets. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

DISTRIBUTION AND HABITAT. Chloris gayana grows in warm-temperate to tropical regions throughout the world, including Mexico. It is cultivated as a meadow grass in irrigated regions of the southwestern United States.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: La Campana, Potrero El Plan; 3 km Ote. [W] carr. [hwy] Panamericana, 13 Sep 1973, Jardín de Observación [observation garden], 1500 m, *Valdés-Reyna VR-237* (MEXU, RELC).

Chloris submutica Kunth, Nov. Gen. Sp. (quarto ed.) 1: 167,
 t. 50. 1815.

FIGURE 70

Perennial; usually caespitose, occasionally shortly stoloniferous. Culms 30-75 cm tall, erect. Sheaths glabrous; ligules about 0.5 mm long, short ciliate; blades to 20 cm long, to 5 mm wide, sometimes with long basal hairs, otherwise scabrous. Panicles with 5-17 distinct branches in 1-3 closely spaced whorls; branches to 7 cm long, usually erect when young, spreading to reflexed at maturity, averaging 12 spikelets per centimeter. Spikelets with 1 bisexual and 1 staminate floret; lower glumes 1.5-3.2 mm long; upper glumes 2.5-3.4 mm long; lowest lemmas 2.8-3.7 mm long, 0.6-1.1 mm wide, broadly linear to elliptic, mostly glabrous but the margins appressed-pubescent, apex obtuse, not conspicuously bilobed, sometimes mucronate; second florets 1.4-2.2 mm long, 0.3-0.9 mm wide, usually at least twice as long as wide, not lobed, unawned, occasionally mucronate. Caryopsis 1.7–2.3 mm long, 0.5–0.6 mm wide, ellipsoid. 2n =ca. 65, 80.

DISTRIBUTION AND HABITAT. Chloris submutica occurs in the southwestern United States, Mexico, Guatemala, and Colombia to Venezuela. In Mexico it is generally found between 1,000 and 2,100 m.

90. *Chloris virgata* Sw., Fl. Ind. Occid. 1: 203. 1797. *Chloris elegans* Kunth.

FIGURE 71

Annual; usually tufted, occasionally stoloniferous. Culms 10–100+ cm tall. Sheaths usually glabrous; ligules to 4 mm long, erose or ciliate; blades to 30 cm long and 15 mm wide, basal hairs to 4 mm long, otherwise usually glabrous, occasionally pilose. Panicles digitate, with 4-20 distinct branches; branches 5-10 cm long, erect to ascending, averaging 10 spikelets per centimeter. Spikelets strongly imbricate, with 1 bisexual and 1(2) sterile floret(s); lower glumes 1.5-2.5 mm long; upper glumes 2.5-4.3 mm long; lowest lemmas 2.5-4.2 mm long, keels usually prominently gibbous, glabrous, or conspicuously pilose, sides not grooved, margins glabrous, scabrous or pilose basally with conspicuously longer hairs distally, the hairs 1.5-2.4 mm long, lemma apex not conspicuously bilobed, awned, the awns 2.5-15 mm long; second florets 1.4-2.9 mm long, 0.4-0.8 mm wide, somewhat widened distally, not inflated, bilobed, lobes less than 1/5 as long as the lemmas, awned from the sinuses, the awns 3-9.5 mm long; third florets greatly reduced, unawned and shorter than the subtending rachilla segment or absent but the rachilla segment present. Caryopsis 1.5-2 mm long, about 0.5 mm wide, elliptic. 2n = 20, 26, 30, 40.

DISTRIBUTION AND HABITAT. *Chloris virgata* is a widespread species that grows in many habitats, from tropical to temperate areas with hot summers, including much of the United States, and is a common weed in alfalfa fields of the southwestern United States.

Cortaderia Stapf

Perennial; often dioecious or monoecious; caespitose. Culms erect, densely clumped. Leaves primarily basal; sheaths open, often overlapping, glabrous or hairy; auricles absent; ligules of hairs; blades flat to folded, arching, edges usually sharply serrate. Inflorescences terminal, plumose panicles, subtended by a long, ciliate bract; branches stiff to flexible. Spikelets somewhat laterally compressed, usually unisexual, sometimes bisexual, with 2–9 unisexual florets; disarticulation above the glumes and below the florets. Glumes unequal, nearly as long as the spikelets,

hyaline, 1-veined; calluses pilose; lemmas 3- to 5(7)-veined, long-acuminate, bifid and awned or entire and mucronate; lemmas of pistillate and bisexual florets usually long-sericeous; lemmas of staminate florets less hairy or glabrous; lodicules 2, cuneate and irregularly lobed, ciliate; paleas about ½ as long as the lemmas, 2-veined; anthers of bisexual florets 3, 1.5-6 mm long, those of the pistillate florets smaller or absent. Caryopsis 1.5-3 mm long. x = 9.

Cortaderia, a genus of 21 species, is native to South America and New Zealand, with the majority of species being South American (Soreng et al., 2017b).

91. Cortaderia selloana* (Schult. & Schult. f.) Asch. & Graebn., Syn. Mitteleur. Fl. 2(1): 325. 1900. Arundo selloana Schult. & Schult. f., Mant. 3 (Add. 1): 605. 1827.

FIGURE 72

Plants usually dioecious, sometimes monoecious. Culms 2–4 m tall, usually 2–4 times as long as the panicles. Leaves primarily basal; sheaths mostly glabrous, with a dense tuft of hairs at the collars; ligules 1–2 mm long; blades to 2 m long, 3–8 cm wide, mostly flat, cauline, ascending, arching, bluish-green, abaxial surfaces glabrous basally. Panicles 30–130 cm long, only slightly, if at all, elevated above the foliage, whitish or pinkish when young. Spikelets 15–17 mm long; calluses to 1 mm long, with hairs to 2 mm; lemmas long-attenuate to an awn, awns 2.5–5 mm long; paleas to 4 mm long; stigmas exserted. Caryopsis and florets not separating easily from the rachilla. 2n = 72.

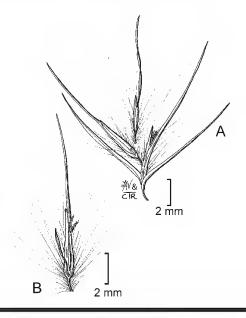

FIGURE 72. Cortaderia selloana. A. Spikelet. B. Florets. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

DISTRIBUTION AND HABITAT. Cortaderia selloana is native to central South America. It is cultivated as an ornamental in the warmer parts of North America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. There are no herbarium specimens of this species, but it is included here because it often found growing as an ornamental in many cities of Chihuahua.

Cottea Kunth

Perennial; caespitose, softly pilose throughout. Culms 25-70 cm tall, ascending or erect from hard knotty bases. Sheaths pilose, rounded on the backs; blades flat, linear; microhairs of blades each with an elongated basal cell and an inflated terminal cell. Inflorescences terminal, open, rather narrow panicles; disarticulation above the glumes and between the florets. Spikelets with 6-10 florets, distal florets reduced. Glumes subequal, about as long as the lowest lemmas, pilose, 7- to 13-veined, midveins sometimes prolonged as short awns, apex acuminate or 3-toothed; lemmas rounded on the backs, with 9-13 prominent veins, some of these excurrent into antrorsely barbed awns of various lengths, others into awned teeth, awns and teeth not forming a pappus-like crown; paleas slightly longer than the lemmas, 2-veined, 2-keeled, keels hairy; anthers 3. Cleistogamous spikelets, usually consisting of a single floret, produced in the lower sheaths. x = 10.

Cottea is a monotypic American genus.

92. Cottea pappophoroides Kunth, Révis. Gramin. 1: 84. 1829. Culms 25–70 cm tall. Blades 5–15 cm long, 4–7 mm wide. Panicles 8–15 cm long, 2–6 cm wide, green or purplish; branches loosely ascending. Spikelets 5–10 mm (including the awns); glumes 4–5 mm long; lemmas 3–4 mm long, conspicuously longpilose basally, awns and teeth more or less alternating. Caryopsis about 1.5 mm long, plump, elliptical; embryos about ½ as long as the caryopsis. 2*n* = 20.

DISTRIBUTION AND HABITAT. Cottea pappophoroides grows on open hillsides from Arizona and Texas south to central Mexico and from Ecuador to Argentina.

Cynodon Rich.

Perennial; sometimes stoloniferous, sometimes also rhizomatous, often forming dense turf. Sheaths open; auricles absent; ligules of hairs or membranous; blades flat, conduplicate, convolute, or involute, sometimes disarticulating. Inflorescence terminal, digitate or subdigitate panicles of spikelike branches; branches (1)2–20, 1-sided, with 2 rows of solitary, subsessile, appressed, imbricate spikelets. Spikelets laterally compressed, with 1(3) florets, only the lowest floret functional; rachilla extension usually present, sometimes terminating in a reduced floret; disarticulation above the glumes. Glumes usually shorter than the lemmas, membranous, keeled, usually muticous; lower glumes 1-veined; upper glumes 1- to 3-veined, occasionally shortly awned; lemmas membranous to cartilaginous, 3-veined, keeled, keels with hairs, occasionally winged, apex mucronate or muticous; paleas about as long as the lemmas, 2-keeled; anthers 3; style branches 2, plumose; lodicules 2. x = 9.

Cynodon is a genus of nine species, all of which are native to tropical regions of the Eastern Hemisphere. Several species are used as lawn and forage grasses in tropical and warm-temperate regions. The most widespread species, *C. dactylon*, is also the only one encountered in Chihuahua.

 Cynodon dactylon* (L.) Pers., Syn. Pl. 1: 85. 1805. Panicum dactylon L., Sp. Pl. 58. 1753.

FIGURE 73

Plants stoloniferous, usually also rhizomatous. Culms 5–40(50) cm tall, not becoming woody. Sheaths glabrous or with scattered hairs; collars usually with long hairs, particularly at the margins; ligules about 0.5 mm long, of hairs; blades 1–6(16) cm long, (1)2–4(5) mm wide, flat at maturity, conduplicate or convolute in bud, glabrous or the adaxial surfaces pilose. Panicles with (2)4–6(9) branches; branches 2–6 cm long, in a single whorl, axes triquetrous. Spikelets 2–3.2 mm long; lower glumes 1.5–2 mm long; upper glumes 1.4–2.3 mm long; lemmas 1.9–3.1 mm long, keels not winged, pubescent, margins usually less densely pubescent; anthers dehiscent at maturity; paleas glabrous. 2n = 18, 36.

DISTRIBUTION AND HABITAT. Cynodon dactylon is from temperate regions of the Old World, introduced in America and widely distributed in Canada, United States, Mexico, Central and South America, and the Caribbean Islands.

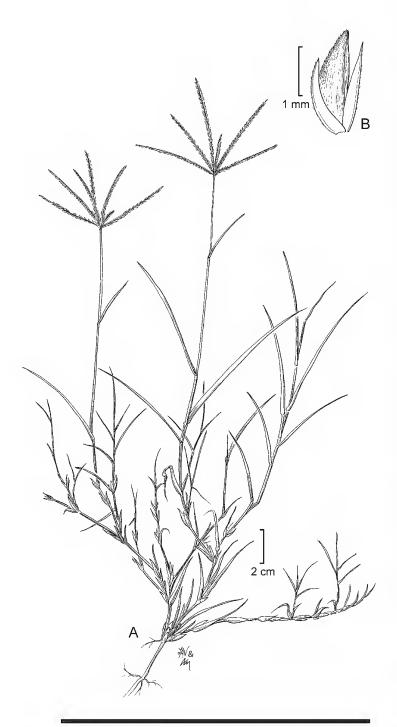

FIGURE 73. Cynodon dactylon. A. Habit. B. Spikelet. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

Dactylis L.

Perennial; caespitose, sometimes with short rhizomes. Culms to 2.1+ m, bases laterally compressed; internodes hollow; nodes glabrous. Leaves mostly basal, glabrous; sheaths closed for at least ½ their length; auricles absent; ligules membranous; blades flat to folded. Inflorescences panicles; primary branches 1-sided, naked proximally, with dense clusters of subsessile spikelets distally, at least some branches longer than 1 cm. Spikelets oval to elliptic in outline, laterally compressed, with 2–6 florets; rachillas glabrous, not prolonged beyond the distal floret; disarticulation above the glumes and beneath the florets. Glumes shorter than the florets, lanceolate, 1- to

3-veined, ciliate-keeled, awn-tipped; calluses short, blunt; lemmas 5-veined, scabrous to ciliate-keeled, tapering to a short awn; paleas 2-keeled, tightly clasped by the lemmas, unawned, apex notched; lodicules 2, glabrous, toothed; anthers 3; ovaries glabrous. Caryopsis shorter than the lemmas, concealed at maturity, oblong to ellipsoid, falling free or adhering to the lemma and/or palea; hila round. x = 7.

Dactylis is interpreted here as a variable monotypic genus, although five species are recognized by Russian taxonomists. Numerous infraspecific taxa have been recognized in Eurasia where Dactylis is native, but it does not seem feasible to identify subspecies and varieties in North America.

94. Dactylis glomerata* L., Sp. Pl. 71 (1753).

FIGURE 74

Culms to 2.1 m tall, erect. Leaves dark green; sheaths longer than the internodes, glabrous, usually keeled; ligules 3–11 mm long, truncate to acuminate; blades (2)4-8(10) mm wide, elongate, lax, with a conspicuous midrib and white, scaberulous to scabrous margins. Panicles 4–20 cm long, typically pyramidal, lower branches spreading, upper branches appressed. Spikelets 5–8 mm long, subsessile; glumes 3–5 mm long; lemmas 4–8 mm long, scaberulous; paleas slightly shorter than the lemmas; anthers 2–3.5 mm long. 2n = 14, 21, 27–31, 42.

DISTRIBUTION AND HABITAT. Dactylis glomerata grows in pastures, meadows, fence rows, roadsides, and similar habitats throughout North America. Native to Eurasia and Africa, it has been introduced throughout most of the cool-temperate regions of the world as a forage grass.

SPECIMENS EXAMINED. MEXICO. Chihuahua. **Juárez**: Universidad Autónoma de Ciudad Juárez, Campus ICB, 15 Abr [Apr] 2005, 1118 m, *R. Corral, M. Vargas & D. Alvarado RCD7084* (UACJ); **Chihuahua**: La Campana, 24 Sep 76, Jardín de observación [observation garden], 1500 m, *S. González* 772 (RELC).

Dactyloctenium Willd.

Annual or perennial; tufted, stoloniferous, or rhizomatous. Culms erect or decumbent, often rooting at the lower nodes, not branching above the base. Sheaths not overlapping, open, keeled; auricles absent; ligules membranous, membranous and ciliate, or of hairs; blades flat or involute. Inflorescences terminal, panicles of 2–11, digitately arranged spicate branches; branches extending beyond the spikelets, terminating in a point, the spikelets imbricate in 2 rows on the lower sides. Spikelets with 3–7 bisexual florets, additional sterile florets distally; disarticulation usually above the glumes, the florets falling as a unit. Glumes unequal, shorter than the adjacent lemmas, 1-veined, keeled; lower glumes acute, mucronate; upper glumes subapically awned, awns curved; calluses glabrous; lemmas membranous, glabrous, 3-veined (lateral veins sometimes indistinct), strongly keeled, apex entire, mucronate, or awned; paleas glabrous; anthers 3, yellow; ovaries

glabrous; styles fused. Fruit utricles; seeds falling free of the hyaline pericarp, transversely rugose or granular. x = 10.

Dactyloctenium is primarily an African and Australian genus of 13 species (Soreng et al., 2017b).

Dactyloctenium aegyptium* (L.) Willd., Enum. Pl. 2: 1029.
 1809. Cynosurus aegyptius L., Sp. Pl. 72. 1753.

FIGURE 75

Plants tufted annuals or short-lived, shortly stoloniferous perennials. Culms 10-35(100) cm tall, usually geniculately ascending and rooting at the lower nodes. Sheaths keeled, with papillose-based hairs distally; ligules 0.5-1.5 mm long, membranous, ciliate; blades 5-22 cm long, 2-8(12) mm wide, with papillose-based hairs. Panicles with (1)2-6(8) digitately arranged spicate branches; branches 1.5-6 cm long, only the first few spikelets in contact with the spikelets of adjacent branches; branch axes extending beyond the spikelets for 1-6 mm. Spikelets 3-4.5 mm long, about 3 mm wide; glumes 1.5-2 mm long; lower glumes ovate, acute; upper glumes oblong elliptic, obtuse, awned, awns 1-2.5 mm long; lemmas 2.5-3.5 mm long, ovate, midveins extended into curved mucros 0.5-1 mm long; paleas about as long as the lemmas; anthers 0.5-0.8 mm long, pale yellow. Seeds cuboid, about 1 mm long and wide, transversely rugose, light tan to reddish-brown. 2n = 20, 36, 40, 45, 48.

DISTRIBUTION AND HABITAT. Dactyloctenium aegyptium is a widely distributed weed of disturbed sites in Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: SW Chihuahua, Aug 1885, *E. Palmer* 73 (US). Ojinaga: 31 km a Chihuahua, 28 Aug 1978, área agrícola [agricultural area], 1235 m, *Molinar*, *Rodríguez*, *Baray* 49 (MEXU).

Dasyochloa Willd. ex Rydb.

Perennial; stoloniferous, sometimes mat-forming. Culms initially erect, eventually bending and rooting at the base of the inflorescence. Leaves not basally aggregated on the primary culms; sheaths with a tuft of hairs to 2 mm long at the throat; ligules of hairs; blades involute. Inflorescence terminal, short, dense panicles of spikelike branches in a tight capitate cluster, each subtended by leafy bracts and exceeded by the upper leaves; branches with 2-4 subsessile to shortly pedicellate spikelets. Spikelets laterally compressed, with 4-10 florets; disarticulation above the glumes. Glumes subequal to the adjacent lemmas, glabrous, 1-veined, rounded or weakly keeled, shortly awned to mucronate; florets bisexual; lemmas rounded or weakly keeled, densely pilose on the lower ½ and on the margins, thinly membranous, 3-veined, 2-lobed, lobes about ½ as long as the lemmas and obtuse, midveins excurrent into awns as long as or longer than the lobes, lateral veins not excurrent; paleas about as long as the lemmas; anthers 3. Caryopsis oval in cross section, translucent; embryos more than ½ as long as the caryopsis. x = 8.

Dasyochloa is a monotypic genus that is endemic to North America. It has been included in each of the following genera: Munroa, Triodia, Tridens, and Erioneuron.

96. Dasyochloa pulchella (Kunth) Willd. ex Rydb., Agric. Exp. Sta. Agric. Colorado Bull. 100: 18, 37. 1906. Triodia pulchella Kunth, Nov. Gen. Sp. (quarto ed.) 1: 155–156, t. 47. 1815. Tridens pulchellus (Kunth) Hitchc., Fl. Calif. 1: 141. 1912. Erioneuron pulchellum (Kunth) Tateoka, Amer. J. Bot. 48(7): 572. 1961. Munroa pulchella (Kunth) L. D. Amarilla, Darwiniana, n. s. 1(2): 245. 2013.

FIGURE 76

Culms (1)4–15 cm long, scabrous or puberulent; peduncles (internode below the panicles) 3–7(11) cm. Sheaths striate, margins scarious; ligules 3–5 mm long; blades (1)2–6 cm long, abaxial surfaces scabrous, adaxial surfaces scaberulous. Panicles 1–2.5 cm long, 1–1.5 cm wide, densely white-pubescent, light green or purple-tinged. Spikelets (5)6–9(10) mm long, with (4)6–10 florets; lower glumes 6–8.5 mm long; upper glumes 6.5–9 mm long, as long as or longer than the florets; lemmas

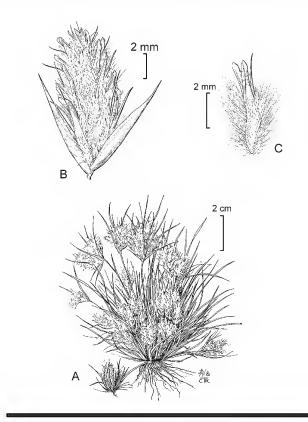

FIGURE 76. Dasyochloa pulchella. A. Habit. B. Spikelet. C. Floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

3–5.5 mm long, lobes (1)3–3.2 mm long, midveins excurrent into straight awns (1.5)2.5–4 mm long; paleas 2–3.5 mm long, keels long pilose proximally, ciliate distally; anthers 0.2–0.5 mm long, Caryopsis 1–1.5 mm long, translucent. 2n = 16.

DISTRIBUTION AND HABITAT. Dasyochloa pulchella grows in rocky soils of arid regions. Its range extends from the western United States southward to central Mexico. It is the most common grass in the *Larrea–Flourensia* scrub of the Chihuahuan Desert, Mexico.

Deschampsia P. Beauv.

Plants usually perennial, some annual; caespitose or tufted. Culms 5-140 cm tall, hollow, erect. Leaves mainly basal, often forming a dense tuft; sheaths open; ligules membranous, decurrent, rounded to acuminate; blades often all or almost all tightly rolled or folded and some flat, sometimes most flat. Inflorescences terminal panicles, open or contracted, disarticulation above the glumes, beneath the florets. Spikelets 3–9 mm long, with 2(3) florets in all or almost all spikelets, florets usually bisexual, sometimes viviparous; rachillas hairy, usually prolonged more than 0.5 mm beyond the base of the distal floret, sometimes terminating in a highly reduced floret. Glumes subequal to unequal, usually exceeding the adjacent florets, often exceeding all florets, 1- or 3-veined, acute to acuminate; calluses antrorsely strigose; lemmas obscurely (3)5- to 7-veined, rounded over the back, apex truncate-erose to 2- to 4-toothed, awned, awns usually attached on the lower ½ of the lemmas, occasionally subapical, straight to strongly geniculate, slightly to strongly twisted proximally, straight distally; paleas shorter than the lemmas, 2-keeled, keels often scabrous; lodicules 2, lanceolate to ovate-lanceolate, usually entire; anthers 3; ovaries glabrous; styles 2. Caryopsis oblong; embryos about $\frac{1}{4}$ the length of the caryopsis. x = 7.

Deschampsia includes 20–40 species. It is best represented in the Americas and Eurasia and grows in cool, damp habitats throughout the world. Two species are native to Chihuahua.

KEY TO SPECIES OF DESCHAMPSIA

- 1. Plants annual; leaves not forming a basal tuft; awns 4–9 mm long, strongly geniculate D. danthonioides
 1. Plants perennial; leaves sometimes forming a basal tuft; awns 1.5–5.5(6) mm long, straight to slightly geniculate
 D. elongata
- Deschampsia danthonioides (Trin.) Munro, Pl. Hartw. 342.
 1857.

FIGURE 77

Annual. Culms 10–40(70) cm tall, erect. Leaves not forming a basal tuft; ligules (0.5)2–3(4.7) mm long, acute to acuminate, entire; blades 0.3–1.5 mm wide, involute or flat. Panicles

5–15(25) cm long, 2–8 cm wide, contracted to open, erect; branches with the spikelets confined to the distal portion. Spikelets 4–9 mm long, bisexual, narrowly V-shaped, usually pale green; glumes exceeding the distal florets, glabrous to scaberulous, 3-veined; lower glumes 4–9 mm long; upper glumes 3.5–8.5 mm long; callus hairs 0.4–1.6 mm long; lemmas 1.5–3 mm long, smooth, shiny, glabrous, pale green or purplish, apex blunt,

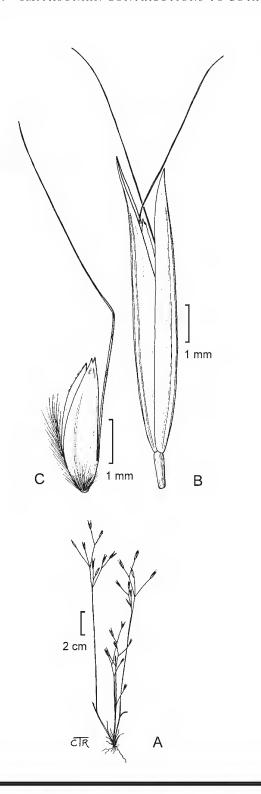

FIGURE 77. *Deschampsia danthonioides*. A. Habit. B. Spikelet. C. Floret. Drawn by Cindy Roché; copyright Utah State University.

erose to 4-toothed, ciliate, the awns 4–9 mm long, attached from near the base to about the middle of the lemmas, strongly geniculate, geniculate above the lemma apex, distal segment 1.5–5 mm long; anthers 0.3–0.5 mm long. 2n = 26.

DISTRIBUTION AND HABITAT. Deschampsia danthonioides grows in temperate and cool-temperate regions, usually in open, wet to dry habitats and often in disturbed ground. Its primary range extends from southern British Columbia to Washington and Idaho, south to Baja California, Mexico. The species has recently been collected in Chihuahua. It also occurs, as a disjunct, in Chile and Argentina.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Gómez Farías: Laguna de Babicora, 18 Aug 1994, 2150 m, *T. Lebgue & E. Estrada* 3324 (NMC).

98. Deschampsia elongata (Hook.) Munro, Pl. Hartw. 342. 1857.

FIGURE 78

Plants perennial; densely caespitose. Culms (10)30–120 cm tall. Leaves sometimes forming a basal tuft; sheaths glabrous; ligules 2.5-8(9) mm long, acute to acuminate; blades 7-30 cm long, 0.2-2 mm wide, usually involute. Panicles 5-30(35) cm long, 0.5-1.5(2) cm wide, erect or nodding; branches erect to ascending. Spikelets 3-6.7 mm long, bisexual, narrowly V-shaped, appressed to the branches; glumes equaling or exceeding the florets, narrowly lanceolate, usually pale green, sometimes purple-tipped, 3-veined, acuminate; lower glumes (3)3.2-5.5(6.7) mm long; upper glumes (3)3.1-5.4(6) mm long; callus hairs 0.3–1.15 mm long; lemmas 1.7–4.3 mm long, smooth, shiny, glabrous, apex weakly toothed or erose, awns 1.5-5.5(6) mm long, straight to slightly geniculate, attached from slightly below to slightly above the middle of the lemma, exceeding the florets by 1-2.5 mm; anthers 0.3-0.5(0.7) mm long. 2n = 26.

DISTRIBUTION AND HABITAT. Deschampsia elongata grows in moist to wet habitats from near sea level to alpine elevations from Alaska and the Yukon south to northern Mexico and east to Montana, Wyoming, and Arizona. It also grows as a disjunct in Chile.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ocampo: Parque Nacional "Cascada de Basaseachic," 25 Abr [Apr] 1986, 1700 m, Spellenberg, R. Soreng, R. Corral & T. Lebgue 8474 (NMC).

Dichanthelium (Hitchc. & Chase) Gould

Perennial; caespitose, sometimes rhizomatous, sometimes with hard, cormlike bases, often with basal winter rosettes of leaves having shortly ovate to lanceolate blades, these often sharply distinct from the blades of the cauline leaves. Culms herbaceous, hollow, usually erect or ascending, rarely sprawling, in the spring often spreading; branches rebranching 1–4 times. Cauline leaves 3–14, usually distinctly longer and narrower than the rosette blades; ligules of hairs, membranous, ciliate, sometimes

absent; pseudoligules of 1–5 mm hairs often present at the bases of the blades immediately behind the true ligules; blades usually distinctly longer and narrower than those of the basal rosette. Inflorescence panicles, terminal on the culms and branches; sterile branches and bristles absent; disarticulation below the glumes. Spikelets 0.8–5.2 mm long, not subtended by bristles, dorsally compressed, surfaces unequally convex, apex unawned. Glumes apex not or only slightly gaping at maturity; lower glumes ½–¾ as long as the spikelets, 1- to 5-veined, truncate, acute, or acuminate; upper glumes slightly shorter than the spikelets or exceeding the upper florets by up to 1 mm long, 5- to 11-veined, not

saccate, apex rounded to attenuate. Lower florets sterile or staminate; lower lemmas similar to the upper glumes; lower paleas sometimes present, thin, shorter than the lower lemmas; upper florets bisexual, sessile, plump, usually apiculate to mucronate, sometimes minutely so, or subacute to (rarely) acute; upper lemmas striate, chartaceous-indurate, shiny, usually glabrous, margins involute; upper paleas striate; anthers 3. Caryopsis smooth; pericarp thin, x = 9.

Dichanthelium is a genus of approximately 62 species, 2 of which are present in Chihuahua. It is often included in *Panicum* sensu lato, the two taxa being similar in gross morphology.

KEY TO SPECIES OF DICHANTHELIUM

- Dichanthelium oligosanthes (Schult.) Gould, Brittonia 26(1): 60. 1974. Panicum oligosanthes Schult., Mant. 2: 256. 1824.

Plants caespitose, with caudices. Basal rosettes welldifferentiated; blades 2-6 cm long, few, ovate to lanceolate. Culms 20-75 cm tall, geniculate basally, stiffly erect distally; nodes glabrous or sparsely pubescent; internodes often purplish, glabrous, puberulent, or papillose-hirsute; fall phase branching from the midculm nodes, branches initially ascending to erect, sometimes developing simultaneously with and overtopping the primary panicles, later rebranching to form short, bushy clumps of blades and small, included secondary panicles. Cauline leaves 5-7; sheaths not overlapping, glabrous, puberulent, or ascending papillose-hispid, margins ciliate, collars loose, puberulent; ligules 1-3 mm long, of hairs; blades 5-12 cm long, 4-15 mm wide, flat or partly involute, glabrous or pubescent abaxially, with 7-9 major veins only slightly more prominent than the minor veins, bases ciliate, rounded to truncate, margins cartilaginous. Primary panicles 5-9 cm long, 3-6 cm wide, partly enclosed to long-exserted, with 6-60 spikelets; branches stiff or wiry, puberulent or scaberulous. Spikelets 2.7-4.2 mm long, 1.7–2.4 mm wide, ellipsoid to broadly obovoid, turgid, glabrous or sparsely pubescent; lower glumes 1-1.6 mm long, acute, similar in texture and vein prominence to the upper glumes; upper glumes strongly veined, often orange to purplish at the base; lower florets sterile; upper florets with minutely umbonate apex.

DISTRIBUTION AND HABITAT. Dichanthelium oligosanthes grows throughout the southern United States and extends into northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: Divisadero Overlook of Cascada de Basaseachic, on trail below overlook, 23 Jun 1987, 2100 m, *T.R. Van Devender, R.K. Van Devender, P.S. Mahrt 10073* (CIIDIR, NMC);

100. Dichanthelium sphaerocarpon (Elliott) Gould, Brittonia 26(1): 60. 1974. Panicum sphaerocarpon Elliott, Sketch Bot. S. Carolina 1(2): 125. 1816.

Plants caespitose. Basal rosettes well-differentiated; blades 2-6 cm long, about 1 cm wide, ovate, the uppermost leaves often resembling the lower cauline blades. Culms 15-50 cm tall, few together, decumbent or ascending, light green, glabrous, slightly fleshy or thickened; fall phase branching mostly near the bases, with sparse branching; nodes appressed-pubescent or glabrous. Cauline leaves 3–4(6); sheaths sometimes overlapping near the bases, glabrous, margins ciliate; ligules almost obsolete, or of 0.2-0.8 mm hairs from a tiny membranous base; blades 1.5–10 cm long, 5–14 mm wide, thick, light green, faintly veined, bases cordate, with papillose-based cilia, margins white, cartilaginous. Primary panicles 4–14 cm long, more than ½ as wide as long, usually long-exserted. Spikelets 1.4-1.8 mm long, broadly obovoid-spherical, usually puberulent, sometimes glabrous; lower glumes 0.4-0.8 mm long, acute to obtuse; upper florets 1.1-1.5 mm long, broadly ellipsoid, blunt.

DISTRIBUTION AND HABITAT. Dichanthelium sphaerocarpon grows in dry, open woods and roadsides. Its range extends from eastern North America to Ecuador and Venezuela.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ocampo: Cascadas de Basaseachic, 6 Jul 1936, LeSueur Mex-0105 (US); Parque Nacional "Cascada de Basaseachic," 0.5 km up the Rio Durazno from the camp area near the parking lot at the head of the falls, 1 Aug 1988, 2000 m, Spellenberg, R. Corral, J Brunt & L. Huenneke 9644 (NMC); Parque Nacional "Cascada de Basaseachic," in the barranca [canyon] at the base of the falls, 11 Nov 1989, 1700 m, Spellenberg, R. Corral, T. Lebgue & M. Mahrt 10072 (NMC).

Dichanthium Willem.

Annual or perennial; caespitose, sometimes with extensive creeping stolons. Leaves usually not aromatic; ligules

membranous, sometimes ciliate. Inflorescence terminal, sometimes also axillary but the axillary inflorescences not numerous; peduncles with 1 to many rames in digitate or subdigitate clusters; rames sometimes naked basally, axes terete to slightly flattened, without a translucent, longitudinal groove, bearing 1 to many sessile-pedicellate spikelet pairs and a terminal triplet of 1 sessile and 2 pedicellate spikelets, basal pair(s) homomorphic and homogamous, staminate or sterile, unawned, persistent, distal spikelet pairs homomorphic but heterogamous, sessile spikelets bisexual and awned, pedicellate spikelets staminate or sterile and unawned; disarticulation in the rames, beneath the bisexual sessile spikelets. Sessile spikelets often imbricate, dorsally compressed, with blunt calluses; lower glumes chartaceous to cartilaginous, broadly convex to slightly concave, sometimes pitted; lower florets reduced, sterile; upper florets sterile or staminate and unawned in the homogamous pairs, bisexual and awned in the heterogamous pairs; awn usually glabrous; anthers (2)3. Pedicels free of the rame axes, terete to somewhat flattened, slender, not grooved. Pedicellate spikelets sterile or staminate. x = 10.

Dichanthium, a genus of 20 species, grows in habitats ranging from subdeserts to marshlands in tropical Asia and Australia. Introduced in America.

101. *Dichanthium annulatum** (Forssk.) Stapf, Fl. Trop. Afr. 9: 178. 1917. *Andropogon annulatus* Forssk., Fl. Aegypt-Arab. 173. 1775.

Perennial; stoloniferous. Culms to 100 cm tall, decumbent, erect portions generally to 60 cm long, often branched above the bases, glabrous beneath the inflorescences; nodes glabrous or short-pubescent. Sheaths glabrous; ligules 1–1.8 mm long, truncate; blades 3–30 cm long, 2–7 mm wide, scabrous, sparsely pilose, hairs sometimes papillose-based. Rames 2–9, 2.5–7 cm long, subdigitate, erect to ascending, bases without spikelets, glabrous, internodes ciliate on the margins. Sessile spikelets 2.5–5 mm long, 1–1.5 mm wide; lower glumes elliptic or oblong, sparsely pubescent below, apex obtuse, irregularly 2- to 3-toothed, 5- to 9-veined; upper glumes 3-veined; awns 1.3–2.2 cm long, twice-geniculate. Pedicellate spikelets 2.5–5 mm long, usually staminate. 2n = 20, 40.

DISTRIBUTION AND HABITAT. Dichanthium annulatum is native to southeastern Asia and is a highly esteemed forage grass, especially in India. It is now established at scattered locations in northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

Digitaria Haller

Annual, perennial, or of indefinite duration. Culms erect or decumbent, branching basally or at aerial culm nodes, when annual or of indefinite duration usually decumbent and rooting at the lower nodes. Sheaths open; ligules membranous, sometimes ciliate; blades usually flat. Inflorescences terminal, sometimes also axillary, usually panicles of 1-sided spikelike branches (sometimes only 1 branch) attached digitately or racemosely to a rachis, sometimes simple panicles of solitary, pedicellate spikelets; spikelike branches, if present, sometimes with secondary branches, primary branch axes triquetrous, bearing spikelets abaxially, in 2 rows, usually in unequally pedicellate groups of 2-5, occasionally borne singly. Spikelets lanceoloid to ellipsoid, dorsally compressed, apex obtuse to acuminate, unawned, with 2 florets; disarticulation beneath the glumes. Lower glumes absent or to ¼ as long as the spikelets; upper glumes usually from 1/4 as long as to equaling the spikelets, occasionally absent, 0- to 5-veined, usually pubescent; lower florets sterile; lower lemmas membranous, usually as long as the upper lemmas, usually pubescent, (3)5- to 7(13)-veined; lower paleas absent or reduced; upper lemmas mostly stiffly chartaceous to cartilaginous, obscurely veined, with hyaline margins that embrace the upper paleas; upper paleas similar to the upper lemmas in texture and size; lodicules 3, cuneate; anthers 3. Caryopsis plano-convex; embryos 1/5-1/2 as long as the caryopsis; hila punctiform to ellipsoid. x = 9.

Digitaria has approximately 200 species and grows primarily in tropical and warm-temperate regions, often in disturbed, open sites.

KEY TO SPECIES OF DIGITARIA

- 1. Inflorescence with 2 or several spiciform branches.
 - 2. Spikelets densely silky-pilose, pubescence white or coppery brown; inflorescence a dense racemose panicle.
 - 2. Spikelets glabrous or with a row of hairs between the veins, but never silky-pilose; inflorescence digitate or subdigitate on the culm axis.
 - 4. Lemma of the bisexual floret light or dark brown to black when mature; blades and sheaths glabrous, pubescent or papillose-pilose.

- 4. Lemma of the bisexual floret light gray or straw-colored when mature; blades essentially glabrous and sparsely papillose-hirsute especially near the collar, in contrast with the always papillose-pilose sheaths.

 - 6. Sterile lemma of the inferior spikelets with notably wider spaces at the interveins nearer to the midvein than lateral ones; sterile lemmas of the pedicellate spikelets glabrous without any hairs.
- 102. Digitaria bicornis (Lam.) Roem. & Schult., Syst. Veg. 2: 470. 1817.

FIGURE 79

Plants of indefinite duration; sometimes stoloniferous. Culms with erect portion 10-85 cm tall, long-decumbent, rooting and branching at the lower nodes. Sheaths with papillose-based hairs or the upper sheaths glabrous; ligules 1-4 mm long; blades 3-14 cm long, 2-9 mm wide, mostly glabrous but the adaxial surfaces with papillose-based hairs basally. Panicles with (2)3-6 spikelike primary branches, these digitate or a few solitary branches below; lowest nodes glabrous or with hairs less than 0.4 mm; primary branches 6.5-21 cm long, 0.6-1.3 mm wide, axes winged, wings at least ½ as wide as the midribs, lower and middle portions with spikelets in unequally pedicellate pairs, pedicels not adnate to the branches; secondary branches absent; shorter pedicels about 0.2 mm; longer pedicels to 2 mm. Spikelets 2.6-3.7 mm long, spikelet pairs dimorphic in their pubescence and venation pattern of the lower lemmas. Lower glumes absent or to 0.9 mm long, deltoid or bifid; upper glumes 1.7–2.8 mm long, ½–¾ as long as the spikelets, 3-veined; lower lemmas 7-veined, veins smooth; lower lemmas of shortly pedicellate spikelets with 3 equally spaced, glabrous or shortly pubescent central veins, lemma margins and the region between the 2 lateral veins with appressed or spreading 0.5-1 mm hairs; lower lemmas of long-pedicellate spikelets with unequally spaced veins, midvein well-separated from the 3 lateral veins, lateral veins crowded together near the margins, lemma margins and the region between the 2 inner lateral veins hairy with appressed or strongly divergent hairs 1-2 mm long, sometimes also with longer, glassy yellow hairs; upper lemmas of all spikelets usually yellow or gray, sometimes light brown at maturity; anthers 0.5-0.6 mm long. 2n = 54, 72.

DISTRIBUTION AND HABITAT. Digitaria bicornis is a common species on the sandy coastal plain of the southeastern United States. Its range extends through Mexico to Costa Rica and northern South America and to the West Indies.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ocampo: ca 1 km W of W boundary of Parque Nacional "Cascada de Basaseachic," 13 km from the Cahuisori–Ocampo road

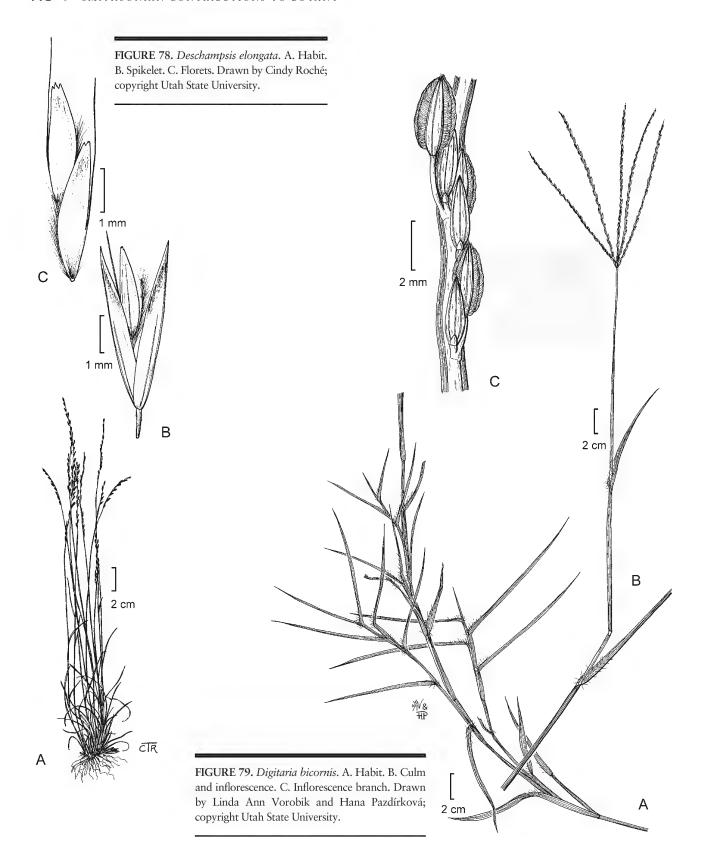

on the road to Candamena, 2.25 km below Cruz, 23 Sep 1994, 1570 m, Spellenberg, Corral & Estrada 12147 (NMC).

103. Digitaria californica (Benth.) Henrard, Blumea 1(1): 99. 1934. Panicum californicum Benth., Bot. Voy. Sulphur 55. 1840.

FIGURE 80

Perennial; caespitose, neither rhizomatous nor stoloniferous. Culms 40-100 cm tall, erect, sometimes geniculate, not rooting, at the lower nodes. Basal sheaths villous; upper sheaths glabrous, densely villous or densely tomentose, or sparsely to densely hairy, with papillose-based hairs; ligules (1)1.5-6 mm long, entire or lacerate, not ciliate; blades 2-12(18) cm long, 2-5(7) mm wide, glabrous or the adaxial surfaces sparsely to densely villous or tomentose. Panicles with 4-10 spikelike primary branches on 5-10 cm rachises, rarely with secondary branches; primary branches 3-6 cm long, appressed to ascending, axes not wing-margined; internodes (mid branch) 2-5.5 mm long, with spikelets in unequally pedicellate pairs; secondary branches rarely present; pedicels not adnate to the branch axes; shorter pedicels 0.1-0.3 mm; longer pedicels 1-2 mm; terminal pedicels of branches 1.7-6(7) mm long. Spikelets homomorphic, (3.7)4–7.5 mm long (including pubescence), 3–5.4 mm long (excluding pubescence), 0.9-1 mm wide; lower glumes 0.4-0.6 mm long; upper glumes 2.5-5.1 mm long (excluding pubescence), narrower than the upper florets, 3-veined, densely villous, hairs 1.5-5 mm long, silvery-white to purple, widely divergent at maturity; lower lemmas 2.7-5 mm long (excluding pubescence), pubescence exceeding the upper florets by 2.2-4 mm, glabrous between the veins, pubescent on the margins, sometimes also on the lateral veins, 7-veined, veins unequally spaced, only the 3 or 5 central veins visible, the hairs 1.5-5 mm long, silvery-white to purple, widely divergent at maturity, intercostal regions glabrous, apex attenuate (acuminate); upper lemmas 2.5–3.4 mm long, ovate-lanceolate, brown to dark brown, acuminate. Caryopsis 1.3–2 mm long. 2n = 36, 54, 70, 72.

DISTRIBUTION AND HABITAT. Digitaria californica grows on plains and open ground from Arizona, southern Colorado, and Oklahoma through Mexico and Central America to South America.

104. Digitaria ciliaris (Retz.) Koeler, Descr. Gram. 27. 1802. Panicum ciliare Retz., Observ. Bot. 4: 16. 1786.

FIGURE 81

Annual or of indefinite duration. Culms 10–100 cm tall, erect portion 30–60 cm long, long-decumbent, rooting and branching at the decumbent nodes, sparingly branched or unbranched from the upper nodes; nodes 2–5, glabrous. Sheaths with papillose-based hairs; ligules 2–3.5 mm long, erose; blades 1.5–14.4(18.9) cm long, 3–9 mm wide, flat, glabrous, a few scattered papillose-based hairs at the base of the adaxial surfaces (occasionally over the whole adaxial surface), usually also scabrous on both surfaces. Panicles with 2–10 spikelike primary

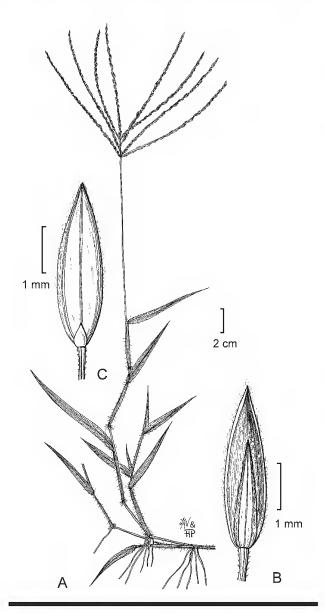

FIGURE 81. Digitaria ciliaris. A. Habit. B. Spikelet showing upper glume and upper lemma. C. Spikelet showing lower glume and lower lemma. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

branches, these digitate or in 1–3 whorls on rachises to 2 cm; lowest panicle nodes with hairs more than 0.4 mm; primary branches 3–24 cm long, 0.6–1.2(2) mm wide, glabrous or with less than 1 mm hairs, axes wing-margined, wings at least ½ as wide as the midribs, lower and middle portions of the branches with spikelets in unequally pedicellate pairs; secondary branches absent; shorter pedicels 0.5–1 mm; longer pedicels 1.5–4 mm.

Spikelets (2.7)2.8–4.1 mm long, homomorphic; lower glumes 0.2–0.8 mm long, acute; upper glumes (1.2)1.5–2.7 mm long, about ½ to almost as long as the spikelet, 3-veined, margins and apex pilose; lower lemmas 2.7–4.1 mm long, 7-veined, veins unequally spaced, outer 3 veins crowded together near each margin, well-separated from the midvein, usually smooth, occasionally the lateral veins scaberulous on the distal ½, margins and regions between the 2 inner lateral veins hairy, hairs 0.5–1 mm long (rarely glabrous), sometimes also with glassy yellow hairs between the 2 inner lateral veins, these more common on the upper spikelets; upper lemmas 2.5–4 mm long, glabrous, yellow, tan, or gray when immature, becoming brown, often purple-tinged (occasionally completely purple) at maturity; anthers 0.6–1 mm long, 2n = 54.

DISTRIBUTION AND HABITAT. Digitaria ciliaris is a weedy species, found in open, disturbed areas in most warm-temperate to tropical regions, primarily in the eastern United States and Mexico.

Specimens Examined. MEXICO. Chihuahua. Batopilas: SW Chihuahua, Aug 1885, E. Palmer 110F (US); Yamuco, 1 mi E of hwy N of Rio Urique crossing, towards Basihuare and Creel, 6 Sep 2008, slopes with pines and oaks, 1890 m, P.M. Peterson & J.M. Saarela 22073 (US). Bocoyna: Barrancas del Cobre, camino [road] a alto río Urique, por Estación Divisadero, 16 Aug 1976, bosque bajo de leguminosas [low legume forest], 1975 m, S. González & J.M. Peña 707 (RELC). Camargo: Cd. Camargo, 1 Aug 1939, L. H. Harvey 1381 (US); Rio Conchos, d. Camargo, 5 Aug 1939, 1220 m, L. H. Harvey 1415 (US). Madera: Mesa del Yerbanís, ejido El Largo, 12 Oct 1990, bosque de Quercus, 1900 m, O. Bravo 1824 (CIIDIR). Riva Palacio: Col. Cumbres de Majalca, 33.8 km W of Mex 45, N of Chihuahua City, 7 Sep 1989, pine forest, 2190 m, P.M. Peterson, Annable & Y. Herrera 7948 (ENCB, US).

105. Digitaria cognata (Schult.) Pilg., Nat. Pflanzenfam. (ed. 2) 14e: 50. 1940. Panicum cognatum Schult., Mant. 2: 235. 1824. Leptoloma cognata (Schult.) Chase, Proc. Biol. Soc. Washington 19(34): 192. 1906.

Perennial; caespitose, without rhizomes. Culms 30–56 cm tall, erect; nodes glabrous. Leaves mainly cauline; sheaths glabrous or sparsely to densely pubescent, sometimes with papillose-based hairs; ligules 0.2–1.5 mm long, entire to lacerate; blades 2.4–12.6 cm long, 2–5.4 mm wide, glabrous or pubescent. Panicles simple, 12.8–27.5 cm long, 16.5–44.5 cm wide, open; branches divergent; lower primary branches 10.5–24 cm long, often with 1 to several sterile branches near the base; pedicels divergent, spikelets solitary. Spikelets 2.2–3.1 mm long, 0.7–1.1 mm wide, obovate or broadly elliptic; lower glumes 0.1–0.8 mm long; upper glumes 1.8–2.8 mm long, 3(5)-veined, glabrous or pubescent between the veins, hairs appearing as a narrow stripe; lower lemmas similar to the upper glumes in length, texture, and pubescence, 7-veined,

veins unequally spaced, lateral veins closer together than the 3 central veins; upper lemmas 1.9-2.9 mm long, glabrous, dark brown, narrowly acute; anthers 0.5-0.7 mm long, yellow or purple. Caryopsis 1.3-1.6 mm long. 2n = 36.

DISTRIBUTION AND HABITAT. *Digitaria cog*nata grows in dry, sandy soils in the eastern portion of Canada through the United States and to southern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: near Chihuahua, 23 Aug 1885, C.G. Pringle 489 (US); La Campana Experimental Station and Rancho El Arco Iris, about 81–84 km along the Pan American hwy to Chihuahua City. cattle pastures, June 1977, J.K. Meents & W.H. Moir 146 (ENCB); La Campana; Potrero la Sierra, 1 km W Carr. [hwy] Panamericana, 31 Aug 1973, pastizal mediano abierto [mostly open grassland], 1500 m, Valdés-Reyna VR-51 (RELC). Henrickson 12795 (NMC); La Campana Experimental Station and Rancho El Arco Iris, 81–84 km along Pan American Hwy to Chihuahua City, Oct 1977, J.K. Meents & W.H. Moir 76 (NMC).

106. Digitaria filiformis (L.) Koeler, Descr. Gram. 26. 1802. Panicum filiforme L., Sp. Pl. 57. 1753.

Annual, or short-lived perennial; caespitose, not rhizomatous. Culms (10)25-150 cm tall, erect or decumbent, branching, sometimes rooting at the lower nodes; nodes 3-6. Sheaths keeled, basal sheaths usually with papillose-based hairs, rarely glabrous; ligules 0.3-1.5 mm long; blades 2-18 cm long, 1-6 mm wide, flat or involute, glabrous, scabrous, or pilose. Panicles with 2–7 spikelike primary branches, these digitate or subdigitate, the rachises to 1 cm in length; longest primary branches 3-25 cm long, 0.2-0.4 mm wide, axes triquetrous, not wing-margined, with spikelets in groups of 2-5 on the lower and middle portions; pedicels glabrous or sparsely pilose. Spikelets 1.3-2.8 mm long; lower glumes to 0.1 mm long or absent; upper glumes 1–2 mm long, from \(\frac{3}{2} \) to almost as long as the spikelets, almost glabrous or sparsely to densely pubescent with clavate to capitate hairs (use 20x magnification), glume apex rounded; lower lemmas equaling the spikelets, glabrous or glandular-pubescent, 5- to 7-veined, veins unequally spaced, outer 3 veins on each side closer to each other than the midvein is to the inner lateral veins; upper lemmas 1.3-2 mm long, apiculate, dark brown at maturity; anthers 0.3-0.6 mm long. 2n = 36, 54.

DISTRIBUTION AND HABITAT. Digitaria filiformis grows throughout the warmer parts of the eastern United States extending into Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: 37.4 km S of Creel on road to Batopilas, 10 Sep 1989, pine forest, 2045 m, *P.M. Peterson, Annable & Y. Herrera 8012* (ENCB, US); 5.5 mi S of Cienegulta de Barranca on road towards Sorichique, 5 Sep 2003, bosque de pino–encino [pine–oak forest], 2125 m, *P.M. Peterson & P. Catalán 17703* (US). Guerrero: near Guerrero, 9 Oct 1887, *C.G. Pringle 1405* (US).

107. Digitaria insularis (L.) Fedde, Just's Bot. Jahresber. 31(1): 778. 1904. Andropogon insularis L., Syst. Nat. (ed. 10) 2: 1304. 1759.

Perennial; caespitose, short rhizomatous, with knotty bases. Culms 80-130 cm tall, erect, with densely villous cataphylls, branching from the lower and middle nodes. Sheaths usually sparsely to densely papillose-hirsute, occasionally glabrous; ligules 4–6 mm long, usually lacerate, not ciliate; blades 20–50 cm long, 10-17 mm wide, lax, smooth or scaberulous abaxially, scaberulous to scabrous adaxially. Panicles 20–35 cm long, 2–10 cm wide, with numerous spikelike primary branches; primary branches 10-15 cm long, appressed to ascending at maturity, axes not wing-margined or with wings less than ½ as wide as the midribs; internodes 3–4.5(6) mm (mid branch), with spikelets in unequally pedicellate pairs; secondary branches rarely present; pedicels not adnate to the branches; shorter pedicels 0.7-2 mm; longer pedicels 2.5-5 mm; terminal pedicels 2-5 mm. Spikelets 5.5-8.2 mm long (including pubescence), 4.2–5.9 mm long (excluding pubescence), 0.5-0.7 mm wide, narrowly ovate, long apiculate; lower glumes 0.6-0.8 mm long; upper glumes 3.5-4.5 mm long, 3- to 5-veined, pubescent on the margins; lower lemmas 4.1-5.7 mm long (exceeded 1.5-5 mm by pubescence), narrowly ovate, 7-veined, pubescent between most, sometimes all, of the veins and on the margin, the veins usually obscured by a dense covering of golden brown hairs, hairs 3-6 mm long, spreading at maturity, intercostal regions on either side of the midvein glabrous or pubescent with shorter, fine, white hairs, sometimes intermixed with the golden brown hairs; upper lemmas 3.2-4.5 mm long, narrowly ovate, brown when immature, dark brown at maturity, acuminate; anthers 1–1.2 mm long. 2n = 36.

DISTRIBUTION AND HABITAT. Digitaria insularis grows in low, open ground in the southern United States and extends to the West Indies, Mexico, and through Central America to Argentina.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 7.4 km W of Balleza on road to Guachochi, 18 Sep 1991, Acacia scrub, 1660 m, *P.M. Peterson, Annable & Valdés-Reyna 10738* (CIIDIR, US). Batopilas: SW Chihuahua, Aug 1885, *E. Palmer 207* (US). Chihuahua: near Chihuahua, Aug 1885, *C.G. Pringle 378* (US). Guachochi: 7.4 km SW of La Bufa and 15 km NE of Batopilas, 920 m, thorn scrub vegetation, 20 Sep 1991, *P.M. Peterson, Annable & Valdés-Reyna 10849* (US).

108. Digitaria sanguinalis* (L.) Scop., Fl. Carniol. (ed. 2) 1: 52. 1771. Panicum sanguinale L., Sp. Pl. 1: 57. 1753.

FIGURE 82

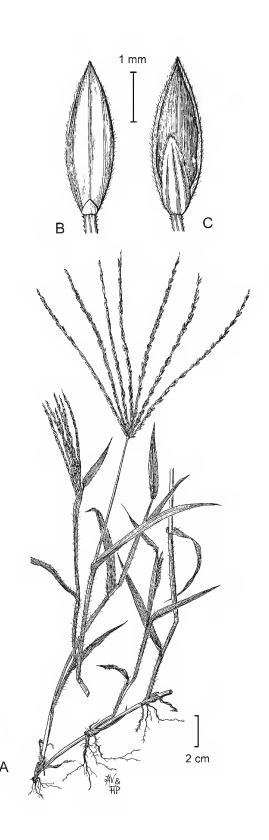

Annual. Culms 20–70(112) tall, often decumbent and rooting at the lower nodes. Sheaths keeled, usually sparsely pubescent with papillose-based hairs; ligules 0.5–2.6 mm; blades 2–11(14) cm long, 3–8(12) mm wide, usually with papillose-based hairs on both surfaces, sometimes glabrous. Panicles with 4–13 spikelike primary branches, these subdigitate or on rachises to 6 cm; primary branches 3–30 cm long, 0.7–1.5 mm wide, flattened

and winged, wings more than $\frac{1}{2}$ as wide as the midribs, lower and middle portion of the branches with spikelets in unequally pedicellate pairs, pedicels not adnate to the branches; secondary branches rarely present. Spikelets 1.7–3.4 mm long, 0.7–1.1 mm wide, homomorphic; lower glumes 0.2–0.4 mm long, veinless; upper glumes 0.9–2 mm long, $\frac{1}{2}$ as long as the spikelets, 3-veined, pubescent on the margins; lower lemmas usually exceeded or equaled by the upper florets, sometimes exceeding them but by no more than 0.2 mm long, glabrous, 7-veined, lateral (or all) veins scabrous throughout or smooth on the lower $\frac{1}{2}$ and scabrous distally, 3 middle veins usually widely spaced, remaining veins on each side close together and near the margins; upper lemmas 1.7–3 mm long, yellow or gray, frequently purple-tinged when immature, often becoming brown at maturity; anthers 0.5–0.9 mm long, 2n = 36, 28, 34, 54.

DISTRIBUTION AND HABITAT. Digitaria sanguinalis is a weedy Eurasian species that is now found in waste ground in fields, gardens, and lawns throughout much of the world, including Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. 109. *Digitaria ternata* (Hochst. ex A. Rich.) Stapf, Fl. Cap. 7: 376–377. 1898.

Annual; geniculate at the base. Culms very variable in size, up to (20)50–125 cm tall. Sheaths glabrous with hyaline margins; ligule membranous truncate; blades 5–20(50) cm long, 4–6 mm wide, flat, apiculate, glabrous, with some cilia adaxially. Panicles 4–10(15) cm long, with 2–10 racemes erect, the rachis shortly winged, pedicels with a ring of stiff hairs just below the spikelets; spikelets 2–2.5 mm long, oblong-elliptic, in pairs and those from the central part, the racemes in triads, 1 sessile and 2 pedicelate, tomentose; lower glumes missing, upper glumes 0.9–1.8 mm long, elliptic-lanceolate, 3-veined, pubescent between veins. Lemmas of the sterile floret 1.8–2.5 mm long, 5-veined, densely pubescent especially in the lateral veins; paleas reduced to a scale; lemma of the fertile floret 1.8–2.5 mm long, elliptic, dark brown.

DISTRIBUTION AND HABITAT. Digitaria ternata grows in open land, grasslands, and road edges; it is known from Mexico to South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Moris: Mesa del Agua, 4.8 km S of Campanero (on Mesa de

Campanero), 29 Sep 2003, 1990 m, T.R. Van Devender, A.L. Reina, M.A. Dimmitt & M.W. Eubanks 2003–1098 (NMC).

Dinebra Jaq.

Plants annual. Culms 13-120 cm tall, not woody. Ligules membranous, truncate, lacerate, sometimes ciliate; blades linear, flat. Inflorescence terminal, panicles of 1-70, 1-sided, spikelike branches, irregularly disposed on elongate rachises, clearly exceeding the upper leaves; branches with 2 rows of 1 or more closely imbricate, sessile spikelets, proximal spikelets sometimes replaced by short, tardily deciduous, secondary branches; disarticulation at the base of the branches or at the base of the secondary branches and (eventually) beneath the florets. Spikelets laterally compressed, cuneate, with 1-3 florets. Glumes subequal, much longer than the florets, usually exceeding the distal florets, coriaceous or membranous, strongly keeled, acuminate-aristate; lemmas thinly membranous, weakly keeled, 3-veined, pilose over the veins, apex acute to 2-lobed, central veins excurrent, forming mucros. Caryopses ellipticoblong, trigonous. x = 10.

Dinebra, a genus of 23 species, is native from Africa to Madagascar and India and in the Americas (Peterson et al., 2012, 2015, 2016). Four species have been reported from Chihuahua.

KEY TO SPECIES OF DINEBRA

- 110. Dinebra panicea (Retz.) P. M. Peterson & N. Snow, Ann. Bot. 109: 1317–1329. 2012. Poa panicea Retz., Observ. Bot. 3: 11. 1783. Leptochloa panicea (Retz.) Ohwi, (Retz.) Ohwi, Bot. Mag. (Tokyo) 55(655): 311. 1941.

Annual. Culms (5)13–150 cm tall, usually erect, compressed, branching; internodes hollow. Sheaths sparsely or densely hairy, particularly distally, hairs papillose-based; ligules 0.6–3.2 mm long, membranous, truncate, erose; blades 6–25 cm long, 2–21 mm wide, glabrous or sparsely pilose on both surfaces. Panicles 8–30 cm long, with 3–100 racemose branches; branches 1–19 cm long, ascending to reflexed. Spikelets 2–4 mm

long, distant to imbricate, green, magenta, or maroon, with 2–5(6) florets; glumes sometimes exceeding the florets, linear to narrowly elliptic, acute, attenuate, or aristate; lower glumes 1.6–4 mm long, linear to lanceolate; upper glumes 1.6–3.6 mm long, lanceolate; lemmas 0.9–1.7 mm long, glabrous or somewhat sericeous, acute to obtuse; paleas glabrous or sericeous; anthers 3, 0.2–0.3 mm long. Caryopsis 0.8–1.2 mm long, 0.5–0.6 mm wide, nearly round in cross section, with or without a ventral groove, apex acute to broadly obtuse.

DISTRIBUTION AND HABITAT. Dinebra panicea is a cosmopolitan species, Two varieties are present in Chihuahua.

KEY TO VARIETIES OF DINEBRA PANICEA

D. panicea subsp. mucronata (Michx.) P. M. Peterson & N. Snow, Ann. Bot. 109: 1317–1329. 2012.

DISTRIBUTION AND HABITAT. United States, Mexico, Central America, South America, and Caribbean Islands.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Bajada de Batopilas, 25 Sep 1981, selva baja [low jungle], 780 m, *R. Fierros 1656* (MEXU); Batopilas, 25 Sep 1981, selva baja, 530 m, *M.E. Siqueiros 1659* (MEXU); along Arroyo Samachique, on N side of Barranca de Batopilas, west of La Bufa, 5 Aug 1973, tree forest, clump grass, 3000 ft, *Bye 4563* (MEXU). Camargo: Km 2 carr. [hwy] Camargo-Chih. 29 Sep 1995, orilla del camino [wayside], 1240 m, *González 93* (MEXU). Chihuahua: SW Chihuahua, Aug-Nov. 1885, *E. Palmer 117* (MEXU).

111. *Dinebra panicoides* (J. Presl) P. M. Peterson & N. Snow, Ann. Bot. 109: 1317–1329. 2012. *Megastachya panicoides* J. Presl, Reliq. Haenk. 1(4–5): 283. 1830. *Leptochloa panicoides* (J. Presl) Hitchc.

Annual. Culms (7)45–110 cm tall, often geniculate below, usually ascending to erect above, rarely branching at the base, often branching distally; internodes hollow. Sheaths glabrous, margins occasionally sparsely ciliate on the basal ½; ligules

2.2–3.8 mm long, membranous, truncate, somewhat erose; blades 4–20 cm long, 4–8 mm wide, both surfaces smooth or scaberulous. Panicles 20–35 cm long, with 20–30(90) racemose branches; branches 2.5–7 cm long, ascending, mostly stiff. Spikelets 4–5 mm long, usually somewhat imbricate, with 4–6(7) florets; lower glumes 0.9–1.9 mm long, usually lanceolate, sometimes falcate, acute; upper glumes 1.8–2.3 mm long, ovate, acute to obtuse; lemmas 2.4–3 mm long, narrowly elliptic to ovate, membranous, midveins and lateral veins sericeous basally, lateral veins prominent, excurrent, apex acute to broadly acute, unawned, sometimes mucronate; paleas glabrous; anthers 3, 0.6–0.8 mm long. Caryopsis 1.1–1.4 mm long, 0.7 mm wide, elliptic, depressed obovate in cross section. 2n = 20.

DISTRIBUTION AND HABITAT. Dinebra panicoides is native from the central Mississippi and Ohio River drainages south through Mesoamerica to Brazil.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: Barranca de Basihuare, 28 Aug 2003, bosque de encino [oak forest], 1700 m, *P.M. Peterson & P. Catalán 17588* (CIIDIR, US).

112. Dinebra scabra (Nees) P. M. Peterson & N. Snow, Ann. Bot. 109: 1317–1329. 2012. Leptochloa scabra Nees, Agrostogr. Bras. 2: 435. 1829.

Annual. Culms (12)20-125 cm tall, mostly erect, often strongly compressed, branching; internodes hollow. Sheaths glabrous, smooth to scabrous; ligules 1.5-2 mm long, membranous, truncate, erose; blades 25-35(50) cm long, 8-16 mm wide, scabrous on both surfaces. Panicles 8-35 cm long, with 50-150 racemose branches; branches (2)5-12 cm long, lax, sometimes arcuate, lower branches often remaining enclosed in the upper leaf sheaths. Spikelets 3-4.5 mm long, usually tightly imbricate, green but straw-colored when dry, with 2-6 florets; glumes sometimes mucronate; lower glumes 0.8-1.6 mm long, narrowly triangular to lanceolate; upper glumes 1.1-2.1 mm long, ovate; rachilla internodes not visible between the florets; lemmas 2.1-2.4 mm long, lanceolate to narrowly ovate, membranous, sparsely sericeous along the lateral veins, apex acute, unawned; anthers 0.2-0.4 mm long. Caryopsis 0.8-1.3 mm long, 0.3-0.5 mm wide, elliptic to obovate, depressed obovate in cross section. 2n = 60.

DISTRIBUTION AND HABITAT. Dinebra scabra is a neotropical species that extends into South America and is uncommon in Mexico and the United States. It is often confused with *D. panicoides*, but it has more flexuous to arcuate panicle branches, shorter spikelets, and less prominent lemma veins. It may also be confused with *Diplachne fusca* subsp. *uninervia*, from which it differs in its acute lemmas.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000).

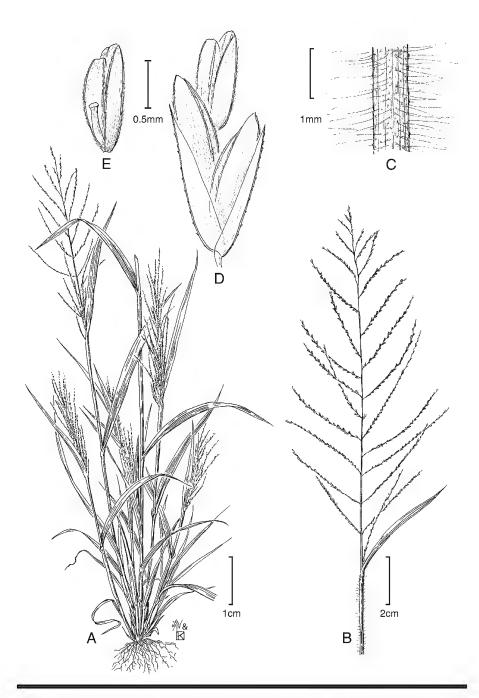

FIGURE 83. *Dinebra panicea* subsp. *brachiata*. A. Habit. B. Inflorescence C. Sheath showing papillose-based hairs. D. Spikelet. E. Floret. Drawn by Linda Ann Vorobik and Karen Klitz; copyright Utah State University.

113. Dinebra viscida (Scribn.) P. M. Peterson & N. Snow, Ann. Bot. 109: 1317–1329. 2012. Diplachne viscida Scribn., Bull. Torrey Bot. Club 10(1): 30. 1883. Leptochloa viscida (Scribn.) Beal, Grass. N. Amer. 2: 434. 1896.

Annual. Culms (3)10-60 cm tall, prostrate or erect, round or somewhat compressed, often highly branched; internodes hollow. Sheaths glabrous (rarely sparsely pilose near the base), sometimes with a sticky exudate; ligules 1.2-2.5 mm long, truncate, erose to lacerate; blades 1-15 cm long, 1.2-5.5 mm wide, glabrous abaxially and adaxially. Panicles 2-17 cm long, with 5-23 racemose branches; branches 1-2.5(3.5) cm long, stiff, often included in the upper leaf sheaths. Spikelets 4.5-7.5 mm long, more or less imbricate, magenta or green, with 2-6 florets; glumes triangular, acute; lower glumes 1.6-2 mm long, acute; upper glumes 2-2.9 mm; lemmas 2.4-3.5 mm long, ovate, membranous, sericeous along the lower veins, lateral veins pronounced, apex acute, obtuse, or truncate, awned, the awns 0.5-1.5 mm long; paleas minutely scabrous along the veins; anthers 3, 0.4–0.5 mm long. Caryopsis 1.2–1.6 mm long, 0.4–0.5 mm wide, narrowly elliptic to obovate, transversely elliptic in cross section, 2n = 40.

DISTRIBUTION AND HABITAT. Dinebra viscida is a Sonoran Desert species that occurs from southern California to southwestern New Mexico and south into adjacent Mexico. It differs from Diplachne fusca subsp. fascicularis, which grows in the same region, in its consistently short-awned lemmas, smaller panicles, often prostrate and much-branched growth habit, and often reddish florets.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: 3 mi W of El Sueco, 16 Sep 1960, Reeder, C. Reeder & Soderstrom 3494 (ARIZ, US). Chihuahua: near Chihuahua, 17 Sep 1885, C.G. Pringle 814 (US); Chihuahua, 14 Oct 1910, Hitchcock 7781 (US). Hidalgo del Parral: 8 mi S of Parral, 2 Oct 1959, Soderstrom 851 (US). Matamoros: 9 mi S of Villa Matamoros, in water of a depression, 7 Sep 1967, 5600 ft, Reeder & C. Reeder 4882 (ARIZ, ENCB, US). Moris: Rancho El Berrendo, junto al preson del [next to] Moris, 17 Oct 1980, pastizal [pastureland], I.D. Enriquez 752 (MEXU).

Diplanchne Haller

Annual. Culms 15–120 cm tall, erect or geniculately ascending. Ligule an eciliate or ciliolate membrane. Inflorescence composed of racemes along a central axis, spreading or deflexed, linear, oblong or cuneate, unilateral, bearing 2–20

fertile spikelets on each; rachis persistent or deciduous from axis, wingless or narrowly winged, flattened or angular. Spikelet appressed, solitary; fertile spikelets sessile, lanceolate or cuneate, laterally compressed, comprising 1-4 fertile florets, with diminished florets at the apex, disarticulating below each fertile floret when mature; rachilla internodes definite. Glumes 1.5-3 length of adjacent fertile lemma, subequal, exceeding apex of florets, persistent, firmer than fertile lemma, lanceolate or elliptic, 1-keeled, (1)2- to 3-veined, apex acute, attenuate or caudate, membranous or coriaceous; fertile lemma ovate, membranous, keeled, wingless, 3-veined, midvein pubescent, surface unwrinkled, without grooves, margins pubescent, apex entire or dentate, bifid, emarginate, obtuse or acute, muticous or mucronate; palea 0.8-0.9 length of lemma, 2-veined, keels eciliate or pubescent. Cryopsis with adherent pericarp, ellipsoid, isodiametric, trigonous.

Diplachne is a genus with two species from Africa, Asia, or Australasia (Peterson et al., 2012, 2015, 2016; Snow et al., in press). A single species occurs in Chihuahua.

114. Diplachne fusca (L.) P. Beauv. ex Roem. & Schult., Syst. Veg. 2: 615. 1817. Leptochloa fusca (L.) Kunth, Révis. Gramin. 1: 91. 1829.

FIGURE 84

Annual or weak perennials. Culms 5-170 cm tall, prostrate to erect; compressed, often branching; internodes hollow. Sheaths glabrous or scabrous; ligules 2-8 mm long, membranous, attenuate, becoming lacerate at maturity; blades 3-50 cm long, 2–7 mm wide, glabrous or scabrous, those of the flag leaves sometimes exceeding the panicles. Panicles (1.5)10–105 cm long, 0.5-22 cm wide, with 3-35 racemose branches, bases of the panicles sometimes remaining enclosed in the upper leaf sheaths at maturity; branches 1.5–20(22) cm long, ascending to reflexed. Spikelets 5-12(14) mm long, with 6-20 florets; lower glumes 1-3(4.9) mm long; upper glumes 1.8-5.5 mm long; lemmas 2-6 mm long, sometimes with a dark spot near the base, apex acute to truncate, sometimes emarginate to bifid, unawned, mucronate, or awned; paleas somewhat sericeous along the veins; anthers 0.2-2.7 mm long, 1-3. Caryopsis 0.8-2.4 mm long, elliptic to ovate or obovate. 2n = 20.

DISTRIBUTION AND HABITAT. Diplachne fusca grows in warm areas throughout the world. There are two subspecies in the region, subsp. uninervia and subsp. fascicularis.

KEY TO SUBPECIES OF DIPLACHNE FUSCA

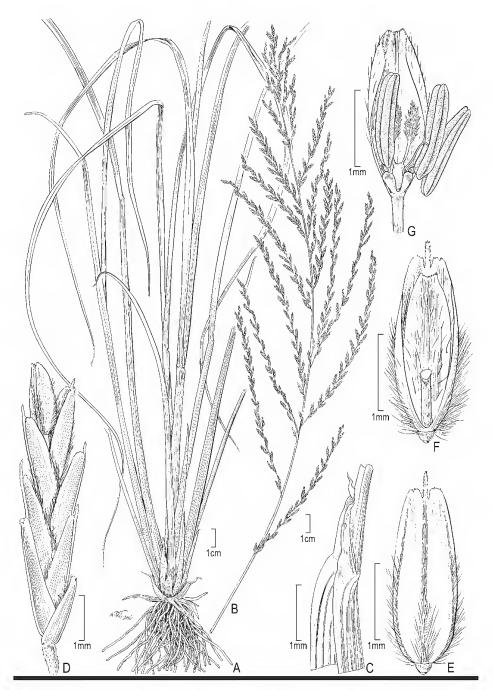

FIGURE 84. *Diplachne fusca* subsp. *fusca*. A. Habit. B. Inflorescence. C. Ligule. D. Spikelet. E. Lemma. F. Floret. G. Palea with lodicules, stamens, and ovary. Drawn by Alice R. Tangerini for Smithsonian Institution, Department of Botany.

Diplachne fusca subsp. fascicularis (Lam.) P. M. Peterson & N. Snow, Ann. Bot. 109: 1317–1329. 2012. Festuca fascicularis L., Amer. Tabl. Encycl. 1: 189. 1791.

DISTRIBUTION AND HABITAT. Diplachne fusca ssp. fascicularis is the most common subspecies from aquatic environments; it grows in cultivated and irrigated places; distributed throughout America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: aprox. 25 km al N del poblado [village] Flores Magón, 7 Oct 1995, 1140 m, R. Corral, P. Olivas & J.O. Torres RCD6464 (UACJ). Camargo: Río Conchos, Cd. Johnston 8870 (MEXU). Madera: Río Aros, 23 Aug 1937, LeSueur 0202 (US). Matamoros: 9 mi S of Villa Matamoros, 7 Sep 1967, Reeder & C. Reeder 4883 (ARIZ, US). Nuevo Casas Grandes: km 33 Nuevo Casas Grandes-Buenaventura 23 Oct 1954, Hern.-Xol. & C. Tapia N-130 (US).

Diplachne fusca subsp. uninervia (J. Presl) P. M. Peterson & N. Snow, Ann. Bot. 109: 1317–1329. 2012. Megastachya uninervia J. Presl, Reliq. Haenk. 1(4–5): 283. 1830.

DISTRIBUTION AND HABITAT. This subspecies is native from the southern United States to Argentina and has been found in Chihuahua growing in an irrigation canal..

SPECIMENS EXAMINED. MEXICO. Chihuahua: Cerca del Río, 15 May 1885, C.G. Pringle 438 (MEXU). Juárez: Parque "El Chamizal", 7 Sep 1995, maleza de prados & canales de riego [grass meadow and irrigation canals], 1120 m, R. Corral RCD6279 (UACJ).

Disakisperma Steud.

Annual or perennial; caespitose. Culms usually ascending to erect, often geniculate at the lower nodes, occasionally prostrate and rooting at the lower nodes, often branching at the aerial nodes; nodes usually glabrous; internodes usually hollow. Leaves usually primarily cauline, occasionally in basal rosettes; sheaths open; ligules obtuse to attenuate, usually membranous, sometimes ciliate; blades flat, involute when dry, usually ascending to erect, apex attenuate. Primary inflorescences terminal, panicles of 2–150 nondisarticulating, spikelike branches, usually exceeding the leaves; branches digitate, subdigitate, or racemose on the rachises, 1-sided, usually spikelet-bearing throughout their length, spikelets in 2 rows, axes terminating in a functional spikelet, lower branches occasionally with secondary branching; secondary panicles sometimes present, axillary to and concealed by the

lower sheaths, their florets not disarticulating; disarticulation in the primary panicles beneath the florets. Spikelets rounded to slightly keeled on the back, distant to tightly imbricate, not conspicuously pubescent, with (2)3-12(20) bisexual florets; rachillas rarely prolonged. Glumes usually unequal, sometimes subequal, exceeded by the florets, membranous, rounded to weakly keeled, 1-veined, veins scabrous, apex unawned (rarely mucronate); florets usually bisexual; calluses distinct or poorly developed, glabrous or pubescent; lemmas membranous, usually pubescent at least over the lower portion of the veins, 3(5)-veined, apex entire or minutely bilobed, unawned, mucronate, or awned; paleas usually subequal to the lemmas, membranous or hyaline. Caryopsis obovate to elliptic, falling free of the lemmas and paleas. x = 10.

Disakisperma was recently segregated from *Leptochloa* and is a genus of four species, with only one in Chihuahua (Peterson et al., 2012; Snow et al., 2013).

115. Disakisperma dubium (Kunth) P. M. Peterson & N. Snow, Ann. Bot. 109: 1317–1329. 2012. Chloris dubia Kunth, Nov. Gen. Sp. (quarto ed.) 1: 169. 1815. Leptochloa dubia (Kunth) Nees, Syll. Pl. Nov. 1: 4. 1824.

FIGURE 85

Perennial. Culms (10)30-110 cm tall, round or basally compressed, tillering from the basal nodes, not branching from the aerial nodes, mostly glabrous, sometimes pilose basally; internodes solid. Sheaths sometimes with a pilose collar; ligules 1-2 mm long, truncate, erose; blades (2)8-35 cm long, 2-8 mm wide, glabrous, strigose, or pilose. Panicles 8-20 cm long, with 2–15 subdigitate or racemose branches; secondary panicles often hidden in the lowest leaf sheaths; branches 2-19 cm long, ascending to spreading at maturity. Spikelets 4-12 mm long, light brown to dark olive-green, with 4-13 florets, often widely divergent at anthesis; glumes narrowly triangular to ovate, acute; lower glumes 2.3-4.8 mm long; upper glumes 3.3-6 mm long; lemmas 3.5-5 mm long, membranous, ovate to obovate, lateral veins glabrous or sericeous, hairs often restricted to the basal portion, sometimes also sericeous on the midvein and between the veins, apex obtuse to truncate, usually emarginate, unawned, sometimes mucronate; paleas ciliate on the margins; anthers 3, 0.3–1.6 mm long. Caryopsis 1.5–2.3 mm long, 0.9–1 mm wide, strongly dorsally compressed. 2n = 40, 60, 80.

DISTRIBUTION AND HABITAT. Disakisperma dubia ranges from the southwestern United States and Florida throughout Mexico to Argentina, often in well-drained, sandy or rocky soils. It provides fair to good forage but is seldom abundant.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Peterson, Annable & Valdés-Reyna 10727 (US).

Distichlis Raf.

Perennial; usually unisexual, occasionally bisexual; strongly rhizomatous and/or stoloniferous. Culms usually erect, glabrous. Leaves conspicuously distichous; lower leaves reduced to scalelike sheaths; upper sheaths strongly overlapping; ligules shorter than 1 mm long, membranous, serrate; upper blades stiff, glabrous, ascending to spreading, usually equaling or exceeding the pistillate panicles. Inflorescences terminal, contracted panicles or racemes, sometimes exceeding the upper leaves. Spikelets laterally compressed, with 2-20 florets; disarticulation of the pistillate spikelets above the glumes and below the florets, staminate spikelets not disarticulating. Glumes 3- to 7-veined; lemmas coriaceous, staminate lemmas thinner than the pistillate lemmas, 9- to 11-veined, unawned; paleas 2-keeled, keels narrowly to broadly winged, serrate to toothed, sometimes with excurrent veins; anthers 3. Caryopsis glabrous, free from the palea at maturity, brown, x = 10.

Distichlis, a genus of 11 species, grows in saline soils of the coasts and interior deserts of the Western Hemisphere and Australia (Peterson et al., 2016). All the species grow in South America, four grow in North America with two in Chihuahua.

KEY TO SPECIES OF DISTICHLIS

- 116. *Distichlis littoralis* (Engelm.) H. L. Bell & Columbus, Syst. Bot. 33(3): 536–551. 2008. *Monanthochloë littoralis* Engelm., Trans. Acad. Sci. St. Louis 1: 437, pl. 13–14. 1859.

Plants with long, wiry stolons. Culms 8–15 cm tall, clustered, erect, with numerous short, leafy, lateral branches. Leaves clustered on distant to closely spaced, short, lateral shoots; sheaths 4–6 mm long, rounded, smooth, shiny, glabrous or puberulent at the base; ligules thickly membranous ciliate rims; blades 0.5–1.5 cm long, 1–2(3) mm wide, stiff, subulate, uniformly manyveined. Inflorescences terminal, composed of a single glabrous spikelet, this enclosed, and almost concealed, by the uppermost leaf sheaths. Pistillate spikelets subterete, with 3–5 florets, distal

florets rudimentary; disarticulation tardy, below the lowest floret; glumes absent; lemmas coriaceous, glabrous, 9-veined, acute; paleas coriaceous, keels prominently winged, wings overlapping and enclosing the caryopses. Staminate spikelets similar to the pistillate spikelets, but smaller and the glumes and lemmas thinner. 2n = 40.

DISTRIBUTION AND HABITAT. Distichlis littoralis grows in moist, sandy, saline soils along the coast of southern California and the southeastern United States, northeastern Mexico, and the Caribbean Islands. It was previously placed in Monanthochloë, but Bell and Columbus (2008) demonstrated that Monanthochloë is nested within Distichlis.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

117. *Distichlis spicata* (L.) Greene, Bull. Calif. Acad. Sci. 2: 415. 1887. *Uniola spicata* L., Sp. Pl. 71. 1753.

FIGURE 86

Plants rhizomatous and sometimes stoloniferous. Culms 10-60 cm long, usually erect, sometimes decumbent or prostrate. Blades of upper leaves 1-8(20) cm long, rigid and divaricate to lax and ascending, usually equaling or exceeding the pistillate panicles, varying with respect to the staminate panicles. Pistillate panicles 1-7 cm long, often congested, with 2-20 spikelets. Pistillate spikelets 5-20 mm long, 4-7 mm wide, with 5-20 florets; lower glumes 2-3 mm long; upper glumes 3-4 mm long; lemmas 3.5-6 mm long; paleas with serrate keels. Caryopsis 2-5 mm long, tapered or truncate. Staminate panicles and spikelets similar to the pistillate panicles and spikelets, but the lemmas somewhat thinner in texture and the paleas not bowed-out; anthers 3-4 mm long, 2n = 40 cm

DISTRIBUTION AND HABITAT. Distichlis spicata grows in saline soils of the Western Hemisphere and Australia and has three varieties; only Distichlis spicata var. mexicana Beetle is found in Chihuahua.

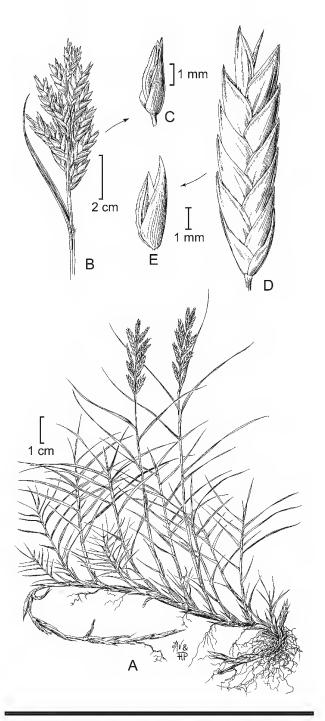

FIGURE 86. *Distichlis spicata*. A. Staminate habit. B. Pistillate inflorescence. C. Pistillate floret. D. Staminate spikelet. E. Staminate floret. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

Echinochloa P. Beauv.

Annual or perennial; with or without rhizomes. Culms 10–460 cm tall, prostrate, decumbent or erect, distal portions sometimes floating, sometimes rooting at the lower nodes; nodes usually glabrous; internodes hollow or solid. Sheaths open, compressed; auricles absent; ligules usually absent but, if present, of hairs; blades linear to linear-lanceolate, usually more than 10 times longer than wide, flat, with a prominent midrib. Inflorescences terminal, panicles of simple or compound spikelike branches attached to elongate rachises, axes not terminating in a bristle, spikelets subsessile, densely packed on the angular branches; disarticulation below the glumes (cultivated taxa not or tardily disarticulating). Spikelets plano-convex, with 2(3) florets; lower florets sterile

or staminate; upper florets bisexual, dorsally compressed; glumes membranous; lower glumes usually $\frac{1}{4}$ as long as the spikelets (varying to more than $\frac{1}{2}$ as long), unawned to minutely awntipped; upper glumes unawned or shortly awned; lower lemmas similar to the upper glumes in length and texture, unawned or awned, awns to 60 mm; lower paleas vestigial to well-developed; upper lemmas coriaceous, dorsally rounded, mostly smooth, apex short or elongate, firm or membranous, unawned; upper paleas free from the lemmas at the apex; lodicules absent or minute; anthers 3. Caryopsis ellipsoid, broadly ovoid or spheroid; embryos usually 0.7–0.9 times as long as the caryopsis. x = 9.

Echinochloa is a tropical to warm-temperate genus of 40–50 species that are usually associated with wet or damp places. Seven species are present in Chihuahua.

KEY TO SPECIES OF ECHINOCHLOA

- 1. Ligules of stiff hairs present on the lower leaves; perennial.
- 1. Ligules usually absent from all leaves, the ligule region sometimes pubescent; plants usually annual, sometimes short-lived perennials.

 - 3. Panicle branches 1–14 cm long, usually rebranched, the secondary branches often short and inconspicuous; spikelets 2.5–5 mm long, awned or unawned.
 - 4. Upper lemmas broadly ovate to elliptical, if elliptical, then each with a line of minute (use 25× magnification) hairs across the base of the early withering tips
 - 4. Upper lemmas narrowly ovate to elliptical, never with a line of minute hairs across the base of the early withering, membranous tips.
 - 6. Spikelets 2.5–3.4 mm long; lower lemmas unawned or with awns 3–10(15) mm long, curved E. crus-pavonis
 - 6. Spikelets 3–5 mm long; lower lemmas usually with awns 8–25 mm long, typically straight.
 - 7. Blades 10–35(60) mm wide; sheaths usually hirsute and the margins ciliate with prominent papillose-based hairs, sometimes the sheaths only papillose; lower lemmas awned, the awns 8–25(60) mm long E. walteri

118. Echinochloa colona* (L.) Link, Hort. Berol. 2: 209. 1833. Panicum colonum L., Syst. Nat. (ed. 10) 2: 870. 1759.

FIGURE 87

Annual; erect or decumbent, caespitose or spreading, rooting from the lower cauline nodes. Culms 10–70 cm tall; lower nodes glabrous or hispid, hairs appressed; upper nodes glabrous. Sheaths glabrous; ligules absent, ligule region frequently brown-purple; blades 8–22 cm long, 3–6(10) mm wide, mostly glabrous, sometimes hispid, hairs papillose-based on or near the margins. Panicles 2–12 cm long, erect, rachises glabrous or sparsely hispid; primary branches 5–10, 0.7–2(4) cm long, erect to ascending, spikelike, somewhat distant, without secondary branches, axes glabrous or sparsely hispid, hairs 1.5–2.5 mm

long, papillose-based. Spikelets 2–3 mm long, disarticulating at maturity, pubescent to hispid, hairs usually not papillose-based, tips acute to cuspidate; lower glumes about ½ as long as the spikelets; upper glumes about as long as the spikelets; lower florets usually sterile, occasionally staminate; lower lemmas unawned, similar to the upper glumes; lower paleas subequal to the lemmas; upper lemmas 2.6-2.9 mm long, not or sparsely exceeding the upper glumes, elliptic, coriaceous portion rounded distally, passing abruptly into a sharply differentiated, membranous, soon-withering tip; anthers 0.7-0.8 mm long. Caryopsis 1.2-1.6 mm long, whitish; embryos 63%-83% as long as the caryopsis. 2n = 54.

DISTRIBUTION AND HABITAT. Echinochloa colona is widespread in tropical and subtropical regions. It is

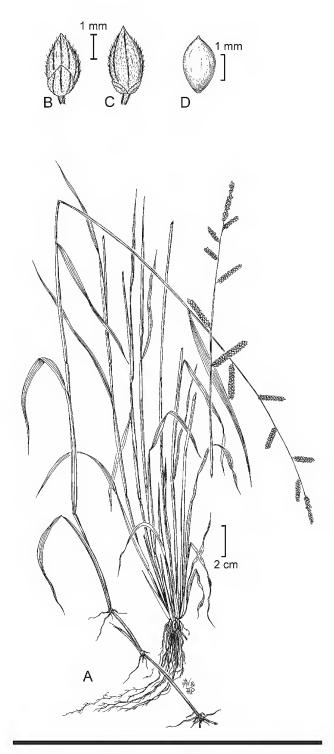

FIGURE 87. Echinochloa colona. A. Habit. B. Spikelet showing lower glume and lower lemma. C. Spikelet showing upper glume. D. Upper lemma. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

adventive and weedy in North America, growing in low-lying, damp to wet, disturbed areas.

FIGURE 88

Annual. Culms 30–200 cm tall, spreading, decumbent or stiffly erect; nodes usually glabrous or the lower nodes puberulent. Sheaths glabrous; ligules absent, ligule region sometimes pubescent; blades to 65 cm long, 5–30 mm wide, usually glabrous, occasionally sparsely hirsute. Panicles 5–25 cm long, with

few to many papillose-based hairs at or below the nodes of the primary axes, hairs sometimes longer than the spikelets; primary branches 1.5–10 cm long, erect to spreading, longer branches with short, inconspicuous secondary branches, axes scabrous, sometimes also sparsely hispid, hairs to 5 mm long, papillose-based. Spikelets 2.5–4 mm long, 1.1–2.3 mm wide, disarticulating at maturity; upper glumes about as long as the spikelets; lower florets sterile; lower lemmas unawned to awned, sometimes varying within a branch, the awns to 50 mm long; lower paleas subequal to the lemmas; upper lemmas broadly ovate to

elliptical, coriaceous portion rounded distally, passing abruptly into an early withering, acuminate, membranous tip that is further demarcated from the coriaceous portion by a line of minute hairs (use $25 \times$ magnification); anthers 0.5-1 mm long. Caryopsis 1.3-2.2 mm long, 1-1.8 mm wide, ovoid or oblong, brownish; embryos 59%-86% as long as the caryopsis. 2n = 54.

DISTRIBUTION AND HABITAT. Echinochloa crusgalli is an Eurasian species that is now widely established in North America, where it grows in moist, disturbed sites, including rice fields.

FIGURE 89

Annual or short-lived perennial. Culms 30–150 cm tall; nodes glabrous. Sheaths glabrous, often purplish; ligules absent; blades 12–60 cm long, 10–25 mm wide, glabrous. Panicles 10–30 cm long, erect or drooping, nodes sparsely hispid, hairs papillose-based, internodes glabrous; primary branches to 14 cm long, nodes sometimes sparsely hispid, hairs papillose-based, internodes usually glabrous; secondary branches to 3 cm. Spikelets 2.5–3.4 mm long, 1.2–1.4 mm wide, disarticulating at maturity; upper glumes subequal to the spikelets; lower florets sterile; lower lemmas unawned or awned, awns 3–10(15) mm long, curved; lower paleas absent, vestigial, or well-developed; upper lemmas narrowly elliptic, not or sparsely exceeding the upper glumes, acute or obtuse, with a well-differentiated, early

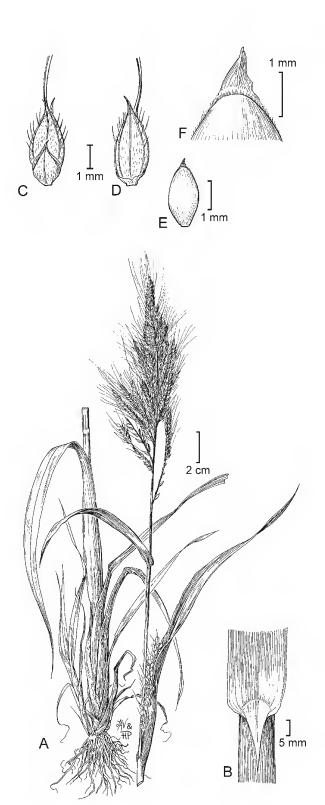

FIGURE 88. Echinochloa crus-galli. A. Habit. B. Ligule. C. Spikelet showing lower glume and lower lemma. D. Spikelet showing upper glume. E. Upper lemma. F. Apex of upper lemma. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

withering tip, glabrous or pubescent at the base of the tip, hairs not forming a line across the base; anthers 0.5-0.7 mm long. Caryopsis 1.2-1.5 mm long, 1-1.3 mm wide; embryos 50%-70% as long as the caryopsis. 2n = 36.

DISTRIBUTION AND HABITAT. Echinochloa crus-pavonis is a native species found in scattered locations from British Columbia to Arizona, east to Florida, and south into Mexico to South America. It favors marshes and wet places at lower elevations, often being found in the water. It has about four varieties, Echinochloa crus-pavonis var. crus-pavonis is in our study area.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Casas Grandes: between Casas Grandes and Sabinal, 4–5 Sep 1899, E.W. Nelson 6355-A (US).

120. *Echinochloa holciformis* (Kunth) Chase, Proc. Biol. Soc. Wash. 24: 155. 1911. *Oplismenus holciformis* Kunth, Nov. Gen. Sp. (quarto ed.) 1: 107. 1815.

Perennial; caespitose. Culms 100–150(200) cm tall, decumbent at the base, rooted at the inferior nodes, glabrous. Sheaths glabrous; ligules 1.5–3.5 mm long, a dense row of rigid hairs; blades 30–45 cm long, 8–15 mm wide, scabrous on the margins. Panicles 15–40 cm long, dense, lightly pendulous, racimes numerous, 6–8 cm long, rachis scabrous and sparsely hispid, spikelets in 4 rows or irregularly grouped, changing to purple or black at maturity, the awns stay green or sometimes purple motted. Spikelets 6.5–9 mm long, densely hispid, with short-plicate hairs; lower glumes 2.6–3.9 mm long, 3-veined, mucronate, upper glumes 6.5–7 mm long, 5-veined mucronate. Lemma of inferior floret sterile, 5-veined, the awn 30–55 mm long; palea missing; superior floret bisexual, lemma of the bisexual floret 5.5–6 mm long, acute, mucronate or awned, awn 1.5–3 mm long; anthers 0.7–1.1 mm long.

DISTRIBUTION AND HABITAT. *Echinochloa holci- formis* is an aquatic or subaquatic species known from Mexico and Central America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. **Madera**: Col. García, 2 Sep 1990, pastizal [pastureland], 2240 m, *A. Benítez* 2192 (CIIDIR).

121. *Echinochloa muricata* (P. Beauv.) Fernald, Rhodora 17(198): 106. 1915.

FIGURE 90

Annual. Culms 80–160 cm tall, erect or spreading, sometimes rooting at the lowest nodes, often developing short axillary

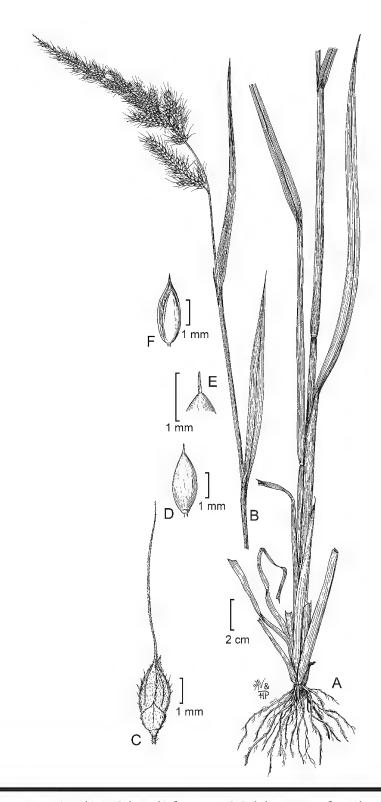

FIGURE 89. *Echinochloa crus-pavonis*. A. Habit. B. Culm and inflorescence. C. Spikelet. D. Upper floret, dorsal view. E. Apex of upper floret. F. Upper floret, ventral view showing palea. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

flowering shoots at most upper nodes when mature; lower nodes glabrous or puberulent; upper nodes glabrous. Sheaths glabrous; ligules absent; blades 1-27 cm long, 0.8-30 mm wide. Panicles of primary culms 7-35 cm long, rachises and branches glabrous or hispid, hairs to 3 mm long, papillose-based; primary branches 2-8 cm long, usually spreading and rather distant, often with secondary branches. Spikelets 2.5-5 mm long, disarticulating at maturity, usually purple or streaked with purple, usually hispid, hairs papillose-based; upper glumes about as long as the spikelets; lower florets sterile; lower lemmas unawned or awned, awns to 16 mm; lower paleas well-developed; upper lemmas broadly obovoid or orbicular, narrowing to an acute or acuminate coriaceous portion that extends into the membranous tip, boundary between the coriaceous and membranous portions not marked by minute hairs; anthers 0.4-1.1 mm long. Caryopsis 1.2-2.5 mm long, broadly obovoid or spheroid, yellowish; embryos 1.4–2 mm long, 80%–91% as long as the caryopsis. 2n = 36.

DISTRIBUTION AND HABITAT. Echinochloa muricata is native to North America, growing from southern Canada to northern Mexico in moist, often disturbed sites (but not rice fields). It resembles E. crus-galli in gross morphology and ecology but differs consistently by not having a line of minute hairs separating the tip of the lemma from the coriaceous base. There are two varieties; only Echinochloa muricata var. microstachya Wiegand is in Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: SW Chihuahua, Aug 1885, E. Palmer 18 (US). Chihuahua: near Chihuahua, 20 Jul 1936, LeSueur 0135 (US). FIGURE 91

Annual. Culms to 100 cm tall, erect, succulent, glabrous, branching from the lower nodes. Sheaths glabrous or hirsute with papillose-based hairs; ligules absent or the ligule region pubescent; blades 10–35 cm long, 5–10 mm wide. Panicles 15–30 cm long, narrow; primary branches appressed to ascending, with papillose-based hairs at the base of the spikelets. Spikelets 4–5 mm long, disarticulating at maturity; glumes with hairs over the veins, glabrous, scabrous, or hirsute between the veins; upper glumes about equal to the spikelets, muticous or awned, awns to 1 mm; lower florets sterile; lower lemmas unawned or awned, the awns 8–16(50) mm long; lower paleas absent or hyaline and subequal to the lemmas; upper lemmas 4–4.5 mm long, 1.7–1.9 mm wide, elliptic; anthers 0.5–0.7 mm long, purple. Caryopsis 2.7–2.9 mm long, 1.7–1.8 mm wide, elliptic in outline, mucronate; embryos about 75% as long as the caryopsis; hila obovate.

DISTRIBUTION AND HABITAT. Echinochloa oplismenoides was previously known from northwestern Mexico to Guatemala; it is now found in southern Arizona (Fishbein, 1995).

oplismenoides.

123. Echinochloa polystachya (Kunth) Hitchc., Contr. U.S. Natl. Herb. 22(3): 135, f. 26. 1920.

Perennial; not rhizomatous. Culms 1-2 m tall, to 1 cm thick, erect or decumbent and rooting at the lower nodes, upper portion sometimes floating distally; nodes glabrous or antrorsely villous. Sheaths mostly glabrous, minutely puberulent, or hispid, hairs papillose-based, throat hispid; ligules 1-5 mm long, present on the lower leaves, of stiff hairs; blades 15-70 cm long, 5-13 mm wide, glabrous. Panicles 13-45 cm long, erect, rachis nodes hispid, hairs 3-6.5 mm long, papillose-based, internodes scabrous; primary branches 4-10 cm long, subverticillate, ascending, nodes hispid, hairs 2.5-4 mm long, papillose-based, internodes scabrous; secondary branches short, spikelets subsessile, in clusters. Spikelets 4-7 mm long, hispid, hairs appressed, disarticulating at maturity; lower glumes at least ½ as long as the spikelets; lower florets staminate; lower lemmas apiculate or awned, awns to 18 mm; lower paleas subequal to the lower lemmas, often purple; anthers of lower florets 1.5-3.6 mm long, orange; upper lemmas 2.5-5 mm long, elliptic or narrowly ovate, apex obtuse, with a membranous, soon-withering tip; anthers of upper florets shorter than those of the lower florets. Caryopsis to 3 mm long. 2n = 54.

DISTRIBUTION AND HABITAT. Echinochloa polvstachya grows in coastal marshes, often in standing water, from Texas to Louisiana and south through Mexico and the Caribbean Islands to Argentina. Echinochloa polystachya var. polystachya is found in Mexico; it has glabrous culms and sheaths; Echinochloa polystachya var. spectabilis (Nees ex Trin.) Mart. Crov., has swollen, pubescent cauline nodes and pubescent sheaths.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Manuel Benavides: entre [between] Manuel Benavides & Pocitos, 2 Aug 1976, pastizal [pastureland], 1342 m, S. González & I.M. Peña 452 (RELC).

FIGURE 92

Annual. Culms (30)50-200+ cm tall, to 2.5 cm thick; nodes pilose or villous, upper nodes usually with sparser and shorter pubescence, occasionally glabrous. Lower sheaths usually hispid, hairs papillose-based, sometimes just papillose; upper sheaths

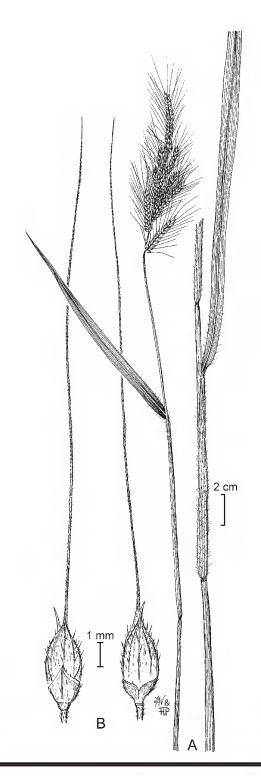

FIGURE 92. Echinochloa walteri. A. Culm and inflorescence. B. Spikelets showing lower glume and lower lemma on left; upper glume on right. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

hirsute or glabrous; ligules absent; blades to 55 cm long, 10-35(60) mm wide, scabrous. Panicles 8.5-35 cm long, erect to slightly drooping, nodes hispid, hairs 3.5-5 mm long, papillosebased, sometimes sparsely so, internodes usually glabrous, sometimes hispid, hairs papillose-based; primary branches 1-10 cm long, loosely erect, not concealed by the spikelets, nodes usually hispid, hairs papillose-based, sometimes glabrous, internodes scabrous, sometimes also sparsely hispid, hairs papillose-based; secondary branches present on the longer primary branches. Spikelets 3-5 mm long, disarticulating at maturity, scabrous to variously muricate and hairy, hairs usually not papillose-based, margins sometimes with a few papillose-based hairs; lower glumes usually more than ½ as long as the spikelets, abruptly narrowing to a fine, 0.5 mm point; lower florets sterile; lower lemmas usually awned, the awns 8-25(60) mm long; lower paleas subequal to the lower lemmas; upper lemmas 3–5 mm long, about 1.5 mm wide, not or sparsely exceeding the upper glumes, narrowly ovate to elliptical, coriaceous portion subacute, tips acuminate, membranous, without a line of hairs at the base of the tip; anthers 0.6-1(1.2) mm long. Caryopsis 1.2-1.8 mm long, brownish. 2n = 36.

DISTRIBUTION AND HABITAT. Echinochloa walteri grows in wet places, often in shallow water and brackish marshes. It is a native species, found in both disturbed and undisturbed sites, although not in rice fields. Occasional specimens of *E. walteri* with glabrous lower sheaths and short awns can be distinguished from *E. crus-pavonis* by having less dense panicles.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

Eleusine Gaertn.

Annual or perennial; caespitose. Culms 10-150 cm tall, herbaceous, glabrous, branching both at and above the base. Sheaths open; ligules membranous, ciliate. Inflorescences terminal, panicles of (1)2–20 nondisarticulating, spikelike branches, exceeding the upper leaves; branches 1-17 cm long, all or most in a digitate cluster, sometimes 1(2) branch(es) attached immediately below the terminal whorl, axes flattened, terminating in a functional spikelet. Spikelets 3.5-11 mm long, laterally compressed, with 2-15 bisexual florets; disarticulation above the glumes and between the florets. Glumes unequal, shorter than the lower lemmas; lower glumes 1- to 3-veined; upper glumes 3- to 5(7)-veined; lemmas 3-veined, glabrous, keeled, apex entire, neither mucronate nor awned; paleas sometimes with winged keels; anthers 3, 0.5-1 mm long; ovaries glabrous. Fruit modified caryopsis, pericarp thin, separating from the seed at an early stage in its development; seeds usually obtusely trigonous, the surfaces ornamented. x = 8, 9, 10.

Eight of the nine species of *Eleusine* are native to Africa, where they grow in mesic to xeric habitats. One species is native in South America; three species are introduced to Mexico, and two of these are present in Chihuahua.

KEY TO SPECIES OF ELEUSINE

- **125.** *Eleusine indica** (L.) Gaertn., Fruct. Sem. Pl. 1: 8. 1788. *Cynosurus indicus* L., Sp. Pl. 1: 72–73. 1753.

FIGURE 93

Annual. Culms 30–90 cm tall, erect or ascending, somewhat compressed; lower internodes 1.5–2 mm thick. Sheaths conspicuously keeled, margins often with long, papillose-based hairs, particularly near the throat; ligules 0.2–1 mm long, truncate, erose; blades 15–40 cm long, 3–7 mm wide, with prominent, white midveins, margins and/or adaxial surfaces often with basal papillose-based hairs. Panicles with 4–10(17) branches, often with 1 branch attached as much as 3 cm below the terminal cluster; branches (3.5)7–16 cm long, 3–5.5 mm wide, linear. Spikelets 4–7 mm long, 2–3 mm wide, with 5–7 florets, obliquely attached to the branch axes; lower glumes 1.1–2.3 mm long, 1-veined; upper glumes 2–2.9 mm long; lemmas 2.4–4 mm long; paleas with narrowly winged keels. Seeds ovoid, rugulose and obliquely striate, usually not exposed at maturity. 2*n* = 18.

DISTRIBUTION AND HABITAT. Eleusine indica is a common weed in warmer regions of the world. It usually grows in disturbed areas and lawns and has been found in most states of contiguous Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: SW Chihuahua, Aug 1885, E. Palmer 40 (US). 126. Eleusine multiflora* Hochst. ex A. Rich., Tent. Fl. Abyss. 2: 412. 1851.

Annual. Culms 20–30 cm tall, forming dense mats, slender, striate, glabrous or pilose. Sheaths flattened, collar sparsely pubescent with white hairs; ligules 0.8–1 mm long, truncate; blades 10–20 cm long, 3–6 mm wide, sparsely hairy. Inflorescence 2–4 short spikes, alternate, 1–4 cm long, over a winged and toothed rachis. Spikelets 4.5–5 mm long, ovate, with 5–10 florets; glumes 3–4 mm long, laterally compressed, carinate, upper glumes with

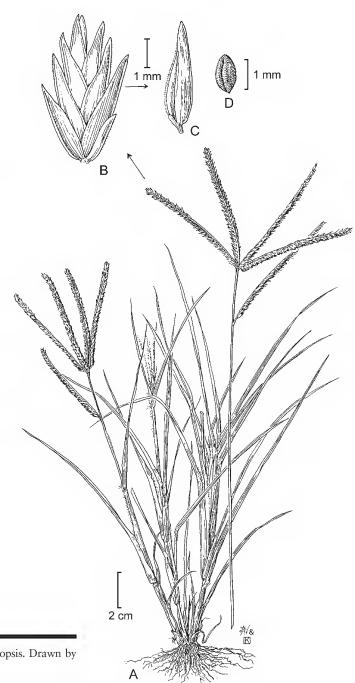

FIGURE 93. Eleusine indica. A. Habit. B. Spikelet. C. Floret. D. Caryopsis. Drawn by Linda Ann Vorobik and Karen Klitz; copyright Utah State University.

a winged keel; lemma 4.5–5 mm long, wide, laterally compressed, apiculate, with a scabrous keel and membranous margins. Caryopsis 1–1.2 mm long, laterally compressed, deeply sulcate, surface scaberulous and densely glandular.

DISTRIBUTION AND HABITAT. Eleusine multiflora is a common weed in the warmer regions of the world, native of Africa. It usually grows in disturbed areas and lawns and has been found in most states of the contiguous United States to Mexico in Aguascalientes, Chiapis, Chihuahua, Coahuila, Distrito Federal, Durango, Guanajuato, Hidalgo, Jalisco, México, Michoacán, Oaxaca, Puebla, Querétaro, San Luis Potosí, Sinaloa, Tlaxcala, and Zacatecas.

Elionurus Humb.& Bonpl. ex Willd.

Perennial, occasionally annual; caespitose, sometimes with short rhizomes. Culms 10–150 cm long, erect, sometimes branching above the base. Leaves sometimes aromatic; sheaths without glandular pits; ligules shortly membranous and densely ciliate or of hairs; blades involute, flat, or folded. Inflorescences terminal, sometimes also axillary, composed of solitary, flexuous rames; rame internodes columnar to clavate, apex strongly oblique, not hollowed or rimmed; disarticulation in the rames, below the sessile spikelets. Spikelets in sessile-pedicellate pairs. Sessile spikelets dorsally compressed; calluses blunt, sometimes resembling a short pedicel; lower glumes enclosing the upper glumes, subcoriaceous, 2-keeled, keels prominently ciliate, intercarinal surface smooth, apex cuspidate to bilobed, rarely entire; lower florets reduced, sterile; upper florets bisexual, unawned; pedicels stout, appressed but not fused to the rame axes, pubescent or ciliate on the angles. Pedicellate spikelets 3-8 mm long, about equal to the sessile spikelets, staminate, muticous to awn-tipped. x = 5.

Elionurus has 15 species. Most species of Elionurus are native to tropical Africa and America; one species is Australian. There are two species found in Mexico and in Chihuahua.

KEY TO SPECIES OF ELIONURUS

- 127. Elionurus barbiculmis Hack., Monogr. Phan. 6: 339. 1889.

Plants caespitose. Culms 40–60 cm tall, erect, usually unbranched, densely antrorsely hirsute to long-pilose beneath the nodes. Sheaths mostly glabrous, often ciliate on the margins, particularly at the throat; ligules with 1–2 mm long hairs; blades 15–30 cm long, 1–2(4) mm wide, usually involute, abaxial surfaces with scattered long hairs adjacent to the margins, adaxial surfaces usually densely pilose. Rames 5–10 cm long, internodes densely villous. Sessile spikelets 4.5–8 mm; calluses about 0.5 mm long, hirsute; lower glumes densely hirsute, acuminate, bifid, teeth 1.5–2.5 mm long; pedicels densely pilose dorsally. Pedicellate spikelets with densely pilose lower glumes. 2*n* = 20.

DISTRIBUTION AND HABITAT. Elionurus barbiculmis grows on mesas, rocky slopes, hills, and in canyons, usually above 1,200 m. Its range extends from southern Arizona and southwestern Texas into northern Mexico.

128. *Elionurus tripsacoides* Humb. & Bonpl. ex Willd., Sp. Pl. 4(2): 941. 1806.

Plants caespitose; with short, knotty, rhizomatous bases. Culms 60-120 cm long, glabrous throughout. Sheaths glabrous or pilose on the margins; ligules 0.5-1 mm long, membranous, short ciliate; blades 16-30 cm long, 2-4 mm wide, adaxial surfaces with hairs to 5 mm basally, glabrous distally, margins ciliate near the bases. Rames 6-15 cm long; internodes pilose. Sessile spikelets 6-8 mm long; calluses about 1 mm long, antrorsely hirsute; lower glumes usually mostly glabrous, rarely sparsely pilose dorsally, keels ciliate distally, apex acuminate, bidentate, teeth about 0.5 mm long; pedicels hirsute on the margins, usually glabrous elsewhere. Pedicellate spikelets similar to the sessile spikelets. 2n = 20.

DISTRIBUTION AND HABITAT. Elionurus tripsacoides grows in moist pine woods and low prairies from southern Texas and the Gulf coast to Georgia, and south through Mexico and Central America to Argentina.

Elymus L.

Perennial; sometimes caespitose, with or without rhizomes, sometimes stoloniferous. Culms usually erect to ascending, sometimes strongly decumbent to prostrate, usually glabrous. Leaves usually evenly distributed, sometimes somewhat basally concentrated; sheaths open for most of their length; auricles often present; ligules membranous, truncate or rounded, sometimes acute, entire or erose, often ciliolate; blades abaxial surfaces usually smooth or scabrous, sometimes with hairs, adaxial surfaces scabrous or with hairs, particularly over the veins, usually with unequal, not strongly ribbed, widely spaced veins, sometimes with equal, strongly ribbed, closely spaced veins. Inflorescences spikes, usually exserted, with 1-3(5) spikelets per node; rachises with scaberulous, scabrous, or ciliate edges. Spikelets usually appressed to ascending, sometimes strongly divergent or spreading, with 1-11 florets, the distal florets often reduced, the lowest florets usually functional, sterile and glume-like in some species; disarticulation usually above the glumes and beneath each floret, sometimes also below the glumes or in the rachises; glumes usually 2, absent or highly reduced in some species, usually equal to subequal, sometimes unequal, usually linear-lanceolate to linear, setaceous, or subulate, sometimes oblanceolate to obovate, (0)1- to 7-veined, sometimes keeled over 1 vein, not necessarily the central vein, the keel vein sometimes extended into an awn; lemmas linear-lanceolate, obscurely 5(7)-veined, apex acute, often awned, sometimes bidentate, sometimes with bristles, awns terminal or from the sinus, straight or arcuately divergent, not geniculate; paleas from shorter than to slightly longer than the lemmas, keels scabrous or ciliate, at least in part. Caryopsis with hairy apex. x = 7.

Elymus is a widespread, north-temperate genus of about 241 species (Soreng et al., 2017b). It now includes Sitanion Raf., but other taxa previously included in Elymus have been moved to Leymus and Thinopyrum (Barkworth, 2007).

KEY TO SPECIES OF ELYMUS

..... E. arizonicus

129. Elymus arizonicus (Scribn. & J. G. Sm.) Gould, Madroño 9(4): 125. 1947. Agropyron arizonicum Scribn. & J. G. Sm., Bull. Div. Agrostol. U.S.D.A. 4: 27–28. 1897. Elytrigia arizonica (Scribn. & J. G. Sm.) D. R. Dewey, Brittonia 35(1): 31. 1983.

Plants caespitose, not rhizomatous. Culms 45-100 cm tall, erect or decumbent at the base; nodes glabrous or almost so. Leaves evenly distributed over the lower ½ of the culms; sheaths glabrous; auricles usually present, to 1 mm long; ligules to 1 mm long on the basal leaves, 1-3 mm on the flag leaves; blades 2.5-7 mm wide, lax, abaxial surfaces smooth and glabrous, adaxial surfaces scabrous, with scattered 0.5-1 mm hairs, veins close together. Spikes 12-25 cm long, 2.5-6 cm wide including the awns, 10-15 mm wide excluding the awns, flexuous, usually nodding or pendent at maturity, with 1 spikelet per node; internodes 11-17 mm long, 0.4–1 mm wide, glabrous, mostly smooth, scabrous on the edges. Spikelets 14-26 mm long, 6-8 mm wide, appressed to divergent, 1.5-2 times as long as the internodes, with 4-6 florets; rachillas glabrous; disarticulation above the glumes and beneath each floret; glumes narrowly lanceolate, margins about 0.2 mm wide, 3(5)-veined, the bases flat, evidently veined, margins hyaline, widest at about midlength, acute or acuminate, unawned or awned, awns to 4 mm long, straight; lower glumes 5-9 mm long, upper glumes 8-10 mm long; lemmas 8-15 mm long, scabrous, rounded on the back, awns 10-25 mm long, arcuately diverging; paleas as long as or longer than the lemmas, tapering, apex truncate, about 0.3 mm wide; anthers 3–5 mm long. 2n = 28.

DISTRIBUTION AND HABITAT. Elymus arizonicus grows in moist, rocky soil in mountain canyons of the southwestern United States and northern Mexico

130. Elymus canadensis L., Sp. Pl. 1: 83-84. 1753.

Plants loosely caespitose, rarely with rhizomes of 1-2 mm thick, often glaucous. Culms (40)60-150(180) cm tall, erect or decumbent; nodes 4–10, mostly concealed by the sheaths, glabrous. Sheaths smooth or scaberulous, glabrous or hirsute, often reddish brown; auricles 1.5-4 mm long, brown or purplish black; ligules to 1(2) mm long, truncate, ciliolate; blades (3)4-15(20) mm wide, usually firm, often ascending and somewhat involute, usually dull green, drying to grayish. Spikes 6-30 cm long, 3-7 cm wide, usually nodding, sometimes pendent or almost erect, usually with 2(3) spikelets per node, occasionally to 5 at some nodes, rarely with 1 at some nodes but never throughout; internodes (2)3-5(7) mm long, or 5-10 mm long toward the base, 0.2-0.35 mm thick at the thinnest sections, glabrous or with a few hairs below the spikelets. Spikelets 12-20 mm long excluding the awns, more or less divergent, with (2)3–5(7) florets, lowest florets functional; disarticulation usually above the glumes and beneath each floret, rarely also below the glumes; glumes usually equal, occasionally subequal, 11-40 mm long including the awns, the basal 0-1 mm subterete and slightly indurate, glume bodies 6-13 mm long, 0.5-1.6 mm wide, linear-lanceolate to subsetaceous, entire, widening or parallel-sided above the base, 3- to 5-veined, glabrous to scabrous-ciliate, rarely villous on the veins, margins firm, awns (5)10–25(27) mm long, straight to outcurving; lemmas 8–15 mm long, glabrous, scabrous, hispid, or uniformly villous with the hairs generally appressed, awns (10)15-40 mm long, moderately to strongly outcurving, often contorted at the spike bases; paleas 7–13 mm long, acute, usually bidentate; anthers 2–3.5 mm long. 2n = 28, rarely 42.

DISTRIBUTION AND HABITAT. Elymus canadensis grows on dry to moist or damp, often sandy or gravelly soil on prairies, dunes, stream banks, ditches, roadsides, and disturbed ground or, especially to the south, in thickets and open woods near streams. It is widespread in most of temperate North America, extending from the southwestern Northwest Territories to northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Camargo: 5 km W of Cd. Camargo, 5 Aug 1939, 1220 m, *L. H. Harvey 1406* (ENCB). Chihuahua: Valley near Chihuahua, 20 Sep 1885, C.G. Pringle 505 (MEXU, US); 14 Oct 1910, Hitchcock 7771 (US).

131. Elymus elymoides (Raf.) Swezey, Doane Coll. Nat. Hist. Stud. 1: 155. 1891. Sitanion elymoides Raf., J. Phys. Chim. Hist. Nat. Arts 89: 103. 1819.

FIGURE 94

Plants caespitose, often glaucous, not rhizomatous. Culms 8–65(77) cm tall, erect or geniculate to slightly decumbent,

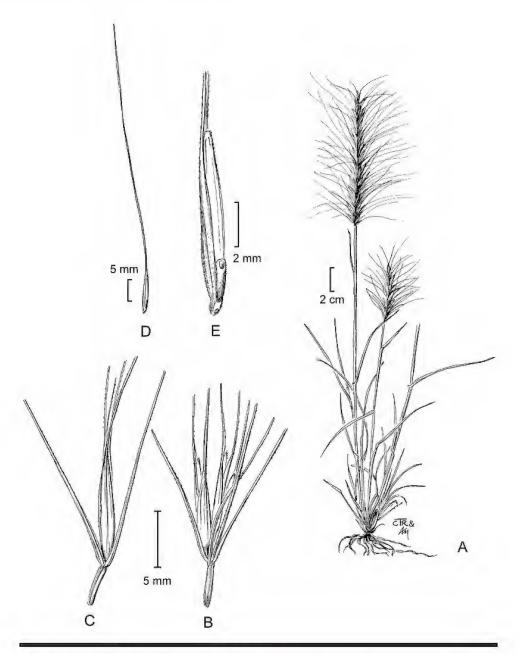

FIGURE 94. *Elymus elymoides* subsp. *brevifolius*. A. Habit. B. Two spikelets. C. Spikelet. D. Lower floret. E. Lower floret, magnified. Drawn by Cindy Roché and Annaliese Miller; copyright Utah State University.

sometimes puberulent; nodes 4–6, mostly concealed, usually glabrous, sometimes pubescent. Leaves evenly distributed; sheaths glabrous, scabrous, puberulent, or densely white-villous; auricles usually present, to about 1 mm long, often purplish; ligules shorter than 1 mm long, truncate, entire or lacerate; blades (1)2–4(6) mm wide, spreading or ascending, often involute, sometimes folded, abaxial surfaces glabrous to puberulent, adaxial surfaces

scabrous, puberulent, hirsute, or white-villous. Spikes 3–20 cm long, 5–15 cm wide, erect to subflexuous, with 2–3 spikelets per node, rarely with 1 at some nodes; internodes 3–10(15) mm long, 0.1–0.4 mm thick at the thinnest sections, usually glabrous, sometimes puberulent beneath the spikelets. Spikelets 10–20 mm long, divergent, sometimes glaucous, at least 1 spikelet at a node with 2–4(5) florets, 1–4(5) florets fertile, sometimes all florets

sterile in the lateral spikelets; disarticulation initially at the rachis nodes, subsequently beneath each floret; glumes subequal, 20-135 mm including the often undifferentiated awns, the bases indurate and glabrous, glume bodies 5-10 mm long, 1-3 mm wide, linear to subulate and setaceous, sometimes highly reduced (as filiform bristles) to absent, 1- to 3-veined, margins firm, awns 15-125 mm long, scabrous, sometimes split into 2-3 unequal divisions, flexuous to outcurving from near the base at maturity; fertile lemmas 6-12 mm long, glabrous, scabrous, or appressed-pubescent, 2 lateral veins excurrent into bristles to 10 mm long, awns 15-120 mm long, about 0.4 mm wide at the base, often reddish or purplish, scabrous, flexuous to curved near the base; paleas 6-11 mm long, veins often excurrent into bristles to 2(5) mm long, apex acute to truncate; anthers 0.9-2.2 mm long. Anthesis from late May to July. 2n = 28.

DISTRIBUTION AND HABITAT. Elymus elymoides grows in dry, often rocky, open woods, thickets, grasslands, and disturbed areas. It is widespread in western North America, from British Columbia to northern Mexico. It comprises four subspecies; only *Elymus elymoides* subsp. *brevifolius* (J. G. Sm.) Barkworth is in Mexico (Chihuahua).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: weeds in the plaza at Creel, 14 Oct 1977, maleza [meadow], 2200 m, Bye & W.A. Weber 8138 (MEXU). 132. *Elymus repens** (L.) Gould, Madroño 9(4): 127. 1947. *Triticum repens* L., Sp. Pl. 1: 86. 1753.

Plants strongly rhizomatous, sometimes glaucous. Culms 50–100 cm tall. Leaves sometimes basally concentrated; sheaths pilose or glabrous proximally; auricles 0.3–1 mm; ligules 0.25–1.5 mm; blades 6–10 mm wide, usually flat, glabrous abaxially or sparsely pilose, adaxial surfaces usually sparsely pilose over the veins, sometimes glabrous, veins smooth, widely spaced,

primary veins prominent, separated by the secondary veins. Spikes 5-15 cm long, 0.5-1.5 cm wide, erect, usually with 1 spikelet per node, occasionally with 2 at a few nodes; internodes 4–6(9.5) mm long, 0.5–1.2 mm wide, smooth or scabrous, glabrous, evenly puberulent, or sparsely pilose, hairs to 0.3 mm. Spikelets 10-27 mm long, appressed to ascending, with 4-7 florets; disarticulation tardy, usually below the glumes, the spikelets falling intact; glumes oblong, glabrous, keeled distally, keels inconspicuous and smooth proximally, scabrous and conspicuous distally, lateral veins inconspicuous, hyaline margins present in the distal ½, apex acute, unawned or awned, awns to 3 mm; lower glumes 8.8-11.4 mm long, 3- to 6-veined; upper glumes 7-12 mm long, 5- to 7-veined; lemmas 8-12 mm long, glabrous, mostly smooth, sometimes scaberulous distally, unawned or with a 0.2-4(10) mm awn, awns straight; paleas 7-9.5 mm long, keels ciliate from ½ to almost the entire length, apex emarginate, truncate, or rounded; anthers 4–7 mm long. 2n = 22, 42.

DISTRIBUTION AND HABITAT. Elymus repens grows well in disturbed sites, spreading rapidly via elongate rhizomes as well as by seed. It is native to Eurasia and established through much of the North America, extending from Alaska to Greenland and south to California, Texas, and northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Sierra Madre, 18 Oct 1887, C.G. Pringle 1176 (MEXU). Bocoyna: Along old road W of Sisoguichic: pine-oak forest region, 12 Aug 1971, Bye 1842 (MEXU). 133. Elymus trachycaulus (Link) Gould ex Shinners, Rhodora 56(663): 28. 1954.

FIGURE 95

Plants caespitose, sometimes weakly rhizomatous. Culms 30–150 cm tall, ascending to erect; nodes usually glabrous. Leaves basally concentrated; sheaths usually glabrous, sometimes markedly retrorsely hirsute or villous; auricles absent or to 1 mm; ligules 0.2–0.8 mm long, truncate; blades 2–5(8) mm wide, flat to involute, usually straight and ascending, abaxial surfaces usually smooth and glabrous, sometimes hairy, adaxial surfaces usually glabrous, sometimes conspicuously hairy. Spikes 4–25 cm long, 0.4–1 cm wide, erect, with 1 spikelet at all or most

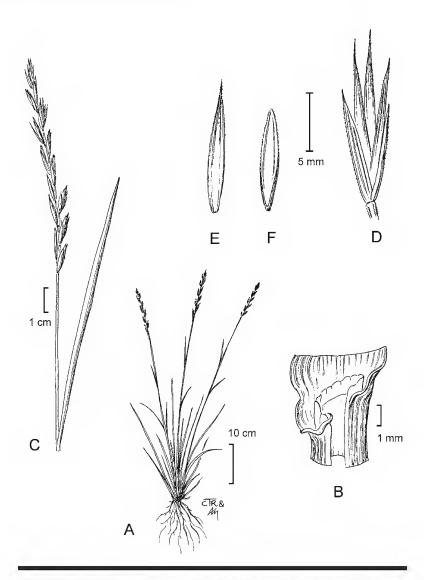

FIGURE 95. Elymus trachycaulus. A. Habit. B. Ligule. C. Inflorescence. D. Spikelet. E. Lemma. F. Palea. Drawn by Cindy Roché and Annaliese Miller; copyright Utah State University.

nodes; internodes (4)7–9(12) mm long, edges scabrous, both surfaces smooth and glabrous. Spikelets 9–17(20) mm long, usually at least twice as long as the internodes, 3–6 mm wide, appressed, with 3–9 florets, lowest florets functional; rachillas glabrous or hairy, hairs to 0.3 mm; disarticulation above the glumes, beneath each floret; glumes subequal, 5–17 mm long, from ¾ as long as to longer than the adjacent lemmas, 1.8–2.3 mm wide, lanceolate to narrowly ovate, widest about midlength, usually green, purple at higher latitudes and elevations, flat or asymmetrically keeled for their full length, 3- to 7-veined, the keel vein usually scabrous, the others smooth or scabrous, only 1 vein excurrent

to the apex, adaxial surfaces glabrous, margins hyaline or scarious, usually more or less equal, 0.2–0.5 mm wide, widest at or slightly beyond midlength, apex acute to awned, awns to 11 mm long; lemmas 6–13 mm long, glabrous, usually smooth proximally, often scaberulous distally over the veins, apex acute, usually awned, awns to 40 mm long, usually straight, sometimes weakly curved if shorter than 10 mm; paleas subequal to the lemmas, keels straight or slightly outwardly curved below the apex, tapering to the apex, apex truncate, 0.15–0.3 mm wide, keel veins often excurrent beyond the intercostal region, sometimes forming teeth; anthers (0.8)1.2–2.5(3) mm long, 2n = 28.

DISTRIBUTION AND HABITAT. Elymus trachycaulus grows from sea level to 3,300 m, usually in open or moderately open areas and sometimes in forests. Its range extends from the boreal forests of North America east through Canada to Greenland and south into Mexico. It has two varieties in Mexico; only Elymus trachycaulus var. trachycaulus is found in Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: Approx. 22.5 mi NE of Cieneguita de Barranca on road towards Creel, 5 Sep 2003, bosque de pino [pine forest], 2160 m, P.M. Peterson & P. Catalán 17690 (US). Madera: Sierra Madre near Col. Garcia, 14 Sep 1899, bosque de encino [oak forest], 2300 m, C.H.T. Townsend & C.M. Barben 328 (US); Chuichupa, 22 Aug 1937, LeSueur 0201 (US). Enneapogon Desv. ex P. Beauv.

Perennial or annual; caespitose, more or less hairy throughout. Culms 3-100 cm tall; nodes hairy; internodes hollow. Sheaths open; ligules of hairs; microhairs of blades each with an elongated basal cell and an inflated terminal cell. Inflorescences terminal, spikelike to somewhat open panicles, bases often included within the uppermost leaf sheath; disarticulation above the glumes but not between the florets, florets falling as a unit. Spikelets with 3-6 florets, frequently only the lowest floret bisexual, distal florets progressively reduced. Glumes subequal, as long as or slightly shorter than the florets (including the awns), more or less pubescent; lower glumes 5- to 7-veined; lemmas firm, rounded on the backs, villous below the middle, strongly 9-veined, veins excurrent into equal, plumose awns 3-5 times as long as the lemma bodies and forming a pappuslike crown; paleas longer than the lemmas, entire, thinly membranous, 2-veined, 2-keeled, keels hairy; anthers 0.2-1.5 mm long, 3; styles 2, free to the base, white x = 10. Enneapogon includes about 24 species. It is found in tropical and warm regions of the world, especially in Africa and Australia.

134. Enneapogon desvauxii P. Beauv., Ess. Agrostogr. 82, 161. t. 16, f. 11. 1812.

FIGURE 96

Perennial. Culms 20–45 cm tall, about 1 mm thick, ascending to erect from a hard knotty base, often branching; nodes pubescent. Sheaths usually shorter than the internodes, more or less pubescent; ligules about 0.5 mm long; blades mostly 2–12 cm long, 1–2 mm wide, more or less hairy, soon involute. Panicles 2–10 cm long, spikelike, grayish-green or lead-colored. Spikelets mostly 5–7 mm long, usually only the lowest floret bisexual; glumes subequal, 3–5 mm long, thin, puberulent; upper

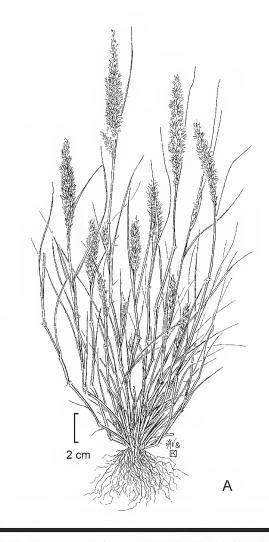

FIGURE 96. Enneapogon desvauxii. A. Habit. B. Spikelet. C. Floret. D. Cleistogamous spikelet. Drawn by Linda Ann Vorobik and Karen Klitz; copyright Utah State University.

glumes often 3- to 4-veined; lowest lemmas 1.5-2 mm long, firm, rounded on the back; awns 3-4 mm long; anthers 0.3-0.5 mm long. Caryopsis 1-1.2 mm long, oval, plump; embryos subequal to the caryopsis. Cleistogamous spikelets commonly present in the lower sheaths, their lemmas larger than those of the florets in the aerial panicles, unawned or with awns that are much reduced. 2n = 20.

DISTRIBUTION AND HABITAT. Enneapogon desvauxii grows in open areas of the southwestern United States and in much of Mexico. It also grows in Peru, Bolivia, Argentina, and most of Africa, extending eastward through Saudi Arabia and India to China.

Eragrostis Wolf

Annual or perennial; usually synoecious, sometimes dioecious; caespitose, stoloniferous, or rhizomatous. Flowering culms not woody, erect, decumbent, or geniculate, sometimes rooting at the lower nodes, simple (without innovations or sprouts at the lower nodes) or branched (with innovations or sprouts at the lower nodes); internodes solid or hollow. Sheaths open, often with tufts of hairs at the apex; ligules usually membranous and ciliolate or ciliate, cilia sometimes longer than the membranous base, occasionally of hairs or membranous and nonciliate; blades flat, folded, or involute. Inflorescences terminal, sometimes also axillary, simple panicles, open to contracted or spikelike, terminal panicles usually exceeding the upper leaves; pulvini in the axils of the primary branches glabrous or hairy; branches not spikelike, not disarticulating, laterally compressed, with 2-45 florets; disarticulation below the fertile florets, sometimes also below the glumes. Glumes usually shorter than the adjacent lemmas, (1)3(5)-veined, not lobed, apex obtuse to acute, awnless; calluses glabrous or sparsely pubescent; lemmas usually glabrous, obtuse to acute, 3(5)-veined, usually keeled, awnless or mucronate; paleas shorter than the lemmas, longitudinally bowed-out by the caryopsis, 2-keeled, keels usually ciliate; anthers 2 or 3; ovaries glabrous. Cleistogamous spikelets occasionally present, sometimes on the axillary or on terminal panicles. Caryopsis variously shaped. x = 10.

Eragrostis, a genus of approximately 444 species, occurs in tropical and subtropical regions throughout the world (Soreng et al., 2017b). There are 18 species of *Eragrostis* in Chihuahua and, of these, 10 are native (Peterson, 2003a; Peterson and Valdés Reyna, 2005).

KEY TO SPECIES OF ERAGROSTIS

1. Annual, caespitose or mat-forming, without innovations at the basal nodes.
2. Palea keels prominently ciliate, the cilia 0.2–0.8 mm long. 3. Spikelets 1.8–3.2 mm long, 1–2 mm wide, with 6–11 florets; lemmas 0.8–1.3 mm long without glands on the keels;
anthers 2
3. Spikelets 6–20 mm long, 2–4 mm wide, with 10–40 florets; lemmas 2–2.8 mm long with 1–3 crateriform glands on
the keels; anthers 3
2. Palea keels smooth or scabrous, the cilia less than 0.2 mm long.
4. Caryopsis with a shallow or deep ventral groove, ovoid to straight angular-prismatic, the surface striate
4. Caryopsis without a ventral groove, usually globose, pyriform, ovoid to prism-shaped, or ellipsoid, the surface smooth to faintly striate.
5. Plants without glandular pits or bands.
6. Lower glumes 0.5–1.5 mm long, at least ½ as long as the lowest lemmas; spikelets 1.2–2.5 mm wide; panicle
branches solitary or paired at the lowest 2 nodes; lemmas with moderately conspicuous lateral veins
E. pectinacea
6. Lower glumes 0.3–0.6(0.8) mm long, usually less than ½ as long as the lowest lemmas; spikelets 0.6–1.4 mm wide; panicle branches usually whorled at the lowest 2 nodes; lemmas within conspicuous lateral veins
5. Place it also be described and be described by the first of the fir
5. Plants with glandular pits or bands somewhere, the location(s) various, including any or all of the following: below the cauline nodes, on the sheaths, blades, rachises, panicle branches, or pedicels, or on the keels of the lemmas.
7. Spikelets 0.6–1.4 mm wide; pedicels 1–10 mm long, lax, appressed or divergent
7. Spikelets 1.1–4 mm wide; pedicels 0.2–4 mm long, stiff, straight, usually divergent.
8. Lemmas 1–1.4 mm long; spikelets with 2–3(5) florets; pedicels with a glandular ring or band; lower glumes
0.5–0.8 mm long; sheaths with papillose-hirsute hairs on the collar E. pringlei
8. Lemmas 1.4–2.8 mm long; spikelets with 7–40 florets; pedicels without a glandular ring or band; lower
glumes 0.9–2 mm long; sheaths without papillose-hirsute hairs on the collar 9. Lemmas 2–2.8 mm long, with 1–3 crateriform glands along the keels; spikelets 6–20 mm long, 2–4 mm
wide, with 10–40 florets; disarticulation below the florets, the rachillas persistent; anthers yellow
E. cilianensis
9. Lemmas 1.4–1.8 mm long, without crateriform glands along the keels; spikelets 4–7(11) mm long, 1.1–
2.2 mm wide, with 7–12(20) florets; disarticulation below the lemmas, both the paleas and rachillas usu-
ally persistent; anthers reddish-brown
1. Perennial, sometimes rhizomatous, forming innovations at the basal nodes. 10. Paleas with a broad lower portion forming a wing or tooth on each side, these often projecting beyond the lemmas.
11. Spikelets 5.5–16 mm long, 2.7–9 mm wide; lemmas 3–5 mm long, the keels without crateriform glands; pedicels
with a narrow band or abscission line just below the apex; anthers 1.4–2.8 mm long E. superba
11. Spikelets 2–5 mm long, 2–3.5 mm wide; lemmas 1.8–2.3 mm long, the keels with a few crateriform glands; pedicels
without a narrow band or abscission line just below the apex; anthers 0.5–0.9 mm long E. echinochloidea
10. Paleas without a broad lower portion forming a wing or tooth, the bases never projecting beyond the lemmas.
12. Plants with short, knotty rhizomes less than 4 mm thick, often stout but never elongated <i>E. spectabilis</i> 12. Plants not rhizomatous
13. Caryopsis with shallowly to deeply grooved adaxial surfaces, straight angular-prismatic to ellipsoid, ovoid, or
obovoid in overall shape.
14. Caryopsis strongly dorsally compressed, translucent, mostly light brown, bases sometimes greenish.
15. Lemmas 1.8-3 mm long; panicles 16-35(40) cm long, (4)8-24 cm wide; blades 12-50(65) cm long;
caryopsis 1–1.7 mm long; ligules 0.6–1.3 mm long
15. Lemmas 1.5–1.7 long; panicles 7–18 cm long, 2–8 cm wide; blades 2–12 cm long; caryopsis 0.6–0.8 mm long; ligules 0.3–0.5 mm long
14. Caryopsis laterally compressed, terete, or slightly dorsally compressed, usually opaque and reddish–brown.
16. Lemmas 1.2–1.6 mm long; culms (20)30–50(60) cm tall; sheaths usually glabrous
16. Lemmas 1.6–3 mm long; culms (30)40–170 cm tall; sheaths usually hairy.
17. Lemmas 1.6–2.2 mm long; anthers 0.5–0.8 mm long, purplish
17. Lemmas 2–3 mm long; anthers 0.6–1.7 mm long, purplish to yellowish.

18. Caryopsis 0.8–1.6 mm long; lemmas 2.4–3 mm long
19. Anthers 2; primary branches stiff; panicles 1–15 cm wide, narrowly oblong to ovate and open; pedicels
0–1(3) mm long, always shorter than the spikelets; spikelets 2.4–5 mm wide
19. Anthers 3.
20. Primary panicle branches not rebranched; proximal spikelets on each branch sessile or subsessile, the
pedicels shorter than 0.4 mm E. sessilispica
20. Primary panicle branches with secondary branches; proximal spikelets on each branch pedicellate, the
pedicels longer than 0.4 mm.
21. Spikelets 2–5.5 mm long; lemmas 1.2–1.6 mm long; culms (20)30–50(60) cm tall E. lugens
21. Spikelets 4–12 (14) mm long; lemmas 1.5–3 mm long; culms (20) 40–150 cm tall.
22. Lemmas 1.8-3 mm long; panicles 16-35(40) cm long, (4)8-24 cm wide; blades 12-50(65) cm
long; caryopsis 1–1.7 mm long; ligules 0.6–1.3 mm long E. curvula
22. Lemmas 1.5-1.7 long; panicles 7-18 cm long, 2-8 cm wide; blades 2-12 cm long; caryopsis

135. Eragrostis barrelieri* Daveau, J. Bot. (Morot) 8: 289. 1894.

FIGURE 97

Caespitose annual; without innovations. Culms (5)10–60 cm tall, erect to decumbent and prostrate, much-branched near the base, somewhat glaucous, with a ring of glandular tissue below the nodes, rings often shiny or yellowish. Sheaths ½-78 the length of the internodes, hairy at the apex, hairs to 4 mm long; ligules 0.2-0.5 mm long, ciliate; blades 1.5-10 cm long, 1-3(5) mm wide, flat, abaxial surfaces glabrous, adaxial surfaces glabrous, sometimes scaberulous, occasionally with white hairs to 3 mm long, margins without crateriform glands. Panicles 4-20 cm long, 2.2–8(10) cm wide, ovate, open to contracted, rachises with shiny or yellowish glandular spots or rings below the nodes; primary branches 0.5-6 cm long, diverging 20°-100° from the rachises; pulvini glabrous; pedicels 1-4 mm long, stout, stiff, divergent, without glandular bands. Spikelets 4-7(11) mm long, 1.1-2.2 mm wide, narrowly ovate, reddish-purple to greenish, occasionally gravish, with 7–12(20) florets; disarticulation acropetal, paleas persistent; glumes broadly ovate, membranous, 1-veined; lower glumes 0.9-1.4 mm long; upper glumes 1.2-1.6 mm long; lemmas 1.4-1.8 mm long, broadly ovate, membranous, lateral veins evident, apex acute to obtuse; paleas 1.3-1.7 mm long, hyaline, keels scabrous, scabrousities to 0.1 mm long, apex obtuse to acute; stamens 3; anthers 0.1-0.2 mm long, reddish-brown. Caryopsis 0.4-0.7 mm long, ellipsoid, not grooved, smooth to faintly striate, light brown. 2n = 40, 60.

Comments: The ring of glandular tissue is most conspicuous below the upper cauline nodes.

DISTRIBUTION AND HABITAT. Eragrostis barrelieri is an introduced European species that is now naturalized in North America. It grows on gravelly roadsides, in gardens, and in other disturbed, sandy sites, especially near railroad yards, at 10–1,800 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Aldama: Rancho la Urraca, acceso [access] de Camargo hacia [toward] Ojinaga, desviar hacia [divert toward] Hércules por

137. Eragrostis ciliaris* (L.) R. Br., Narr. Exped. Zaire 478. 1818. FIGURE 99

Caespitose annual; without innovations. Culms (3)9–75 cm tall, erect or geniculate in the lower portion, not rooting at the lower nodes, glabrous. Sheaths ½–¾ as long as the internodes, hairy on the margins and at the apex, hairs to 4 mm long; ligules 0.2–0.5 mm long; blades 1.8–12(15) cm long, 2–5 mm wide, usually flat, occasionally involute, glabrous or ciliate basally. Panicles 1.7–17 cm long, 0.2–5 cm wide, cylindrical, contracted or open, spikelike, branches forming glomerate lobes or sometimes more open, often interrupted in the lower portion; primary branches 0.4–4 cm long, appressed or diverging up to 50° from the rachises; pulvini usually glabrous, occasionally sparsely pilose; pedicels 0.1–1 mm long, erect, shorter than the spikelets, glabrous. Spikelets 1.8–3.2 mm long, 1–2 mm wide, elliptical-ovate

FIGURE 99. Eragrostis ciliaris. A. Habit. B. Spikelet. C. Floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

to ovate-lanceolate, yellowish-brown, sometimes with a purple tinge, with 6–11 florets, densely packed next to one another or widely separated; disarticulation basipetal, glumes persistent; glumes ovate to lanceolate, keels scaberulous, veins commonly green, apex acute; lower glumes 0.7-1.2 mm long; upper glumes 1-1.6 mm long; lemmas 0.8-1.3 mm long, elliptical-ovate to lanceolate, membranous, keels scaberulous, lateral veins evident, apex obtuse to acute; paleas 0.8-1.3 mm long, membranous, keels prominently ciliate, cilia 0.2-0.8 mm long, apex obtuse to acute; anthers 2, 0.1-0.3 mm long, purplish. Caryopsis 0.4-0.5 mm long, ovoid, reddish-brown. 2n = 20, 40.

DISTRIBUTION AND HABITAT. Eragrostis ciliaris is native to the paleotropics and introduced and naturalized in Mexico and the United States, growing along roadsides, on waste sites, in xerothermic vegetation, and sometimes in saline habitats up to 1,950 m. It may be more widespread than indicated. Eragrostis ciliaris var. ciliaris, found in Chihuahua, is more common than Eragrostis ciliaris var. laxa Kuntze, which is known only from the Yucatán.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Chihuahua, Aug 1885, E. Palmer s.n. (US). Guachochi: 10 km W of La Bufa and 12.9 km NE of Batopilas, 770 m, P.M. Peterson, Annable & Valdés-Reyna 10851 (US).

138. Eragrostis curvula* (Schrad.) Nees, Fl. Afr. Austral. Ill. 397. 1841.

FIGURE 100

Caespitose perennial; forming innovations at the basal nodes. Culms (45)60-150 cm tall, erect, glabrous or glandular. Sheaths 1/3-2/33 the length of the internodes, with scattered hairs, hairs to 9 mm long; ligules 0.6-1.3 mm long; blades 12-50(65) cm long, 1-3 mm wide, flat to involute, abaxial surfaces glabrous, sometimes scaberulous, adaxial surfaces with scattered hairs basally, hairs to 7 mm. Panicles 16-35(40) cm long, (4)8-24 cm wide, ovate to oblong, open; primary branches 3-14 cm long, diverging 10°-80° from the rachises; pulvini glabrous or not, the hairs up to 3 mm long; pedicels 0.5-5 mm long, appressed, flexible. Spikelets 4-8.2(10) mm long, 1.2-2 mm wide, linear-lanceolate, plumbeous to yellowish, with 3-10 florets; disarticulation irregular to acropetal, proximal rachilla segments persistent; glumes lanceolate, hyaline; lower glumes 1.2-2.6 mm long; upper glumes 2-3 mm long; lemmas 1.8-3 mm long, ovate, membranous, lateral veins conspicuous, apex acute; paleas 1.8-3 mm long, hyaline to membranous, apex obtuse; stamens 3; anthers 0.6-1.2 mm long, reddish-brown. Caryopsis 1–1.7 mm long, ellipsoid to obovoid, dorsally compressed, adaxial surfaces with a shallow, broad groove or ungrooved, smooth, mostly translucent, light brown, bases often greenish. 2n = 40, 50.

DISTRIBUTION AND HABITAT. Eragrostis curvula is native to southern Africa and introduced in North America. It is often used for reclamation because it provides good ground cover but, once introduced, it easily escapes. In North America, it grows on rocky slopes, at the margins of woods, along

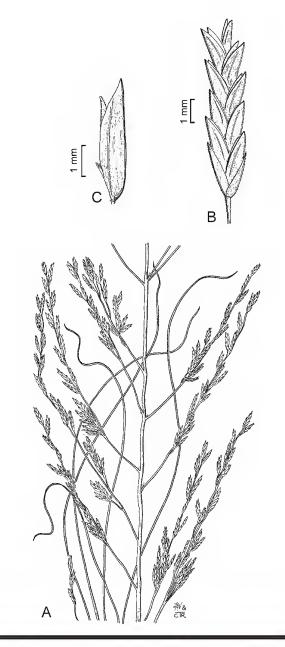

FIGURE 100. Eragrostis curvula. A. Inflorescence. B. Spikelet. C. Floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

roadsides, and in waste ground, usually in pine-oak woodlands, and in yellow pine and mixed hardwood forests at 10-2,000 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Barranca de Batopilas, 28 Oct 1973, *Bye 5646* (MEXU). Chihuahua: La Campana, 24 Sep 76, Jardín de observación [observation garden], 1500 m, *S. González 764*, 766 (RELC).

139. Eragrostis echinochloidea* Stapf, Fl. Cap. 7: 627. 1900.

FIGURE 101

Caespitose perennial; with innovations. Culms 30–100 cm tall, erect to geniculate, with narrow, sunken glandular bands. Sheaths sometimes glandular, apex hairy, hairs to 5 mm long; ligule 0.4-1 mm long; blades 5-20 cm long, 2-6(7) mm wide, flat to involute, with small crateriform glands on the keels and veins, sparsely pilose adaxially. Panicles 4-19 cm long, 0.8-7 cm wide, oblong to ovate, glomerate, spikelets clustered in 1-sided groups; primary branches 0.5-7.5 mm long, angled, sinuous, glandular; pulvini hairy, hairs to 2 mm long; pedicels 0.2-2 mm long, stout, erect, without a narrow band of abscission line near the apex. Spikelets 2-5 mm long, 2-3.5 mm wide, broadly ovate, greenish, stramineous to plumbeous, with 7-14 florets, disarticulation basipetal, glumes persistent; glumes subequal, 1.7–2.2 mm long, ovate, membranous, keels with small crateriform glands, apex acute to acuminate; lemmas 1.8-2.3 mm long, broadly ovate to orbicular, chartaceous, keels with small crateriform glands, apex acute to obtuse; paleas 1.7-2.2 mm long, chartaceous, each side with a broad wing at the base, wings often projecting beyond the lemma bases, apex acute; anthers 3, 0.5-0.9 mm long, yellowish. Caryopsis 0.8-1.1 mm long, ellipsoid, reddish-brown. 2n = 30.

DISTRIBUTION AND HABITAT. Eragrostis echinochloidea is native to southern Africa and seems to be spreading rapidly in Mexico. It is now established in Chihuahua and San Luis Potosí, Mexico, and Arizona, United States. It grows in gravelly soils, often along roadsides and sidewalks; 1,800–2,200 m.

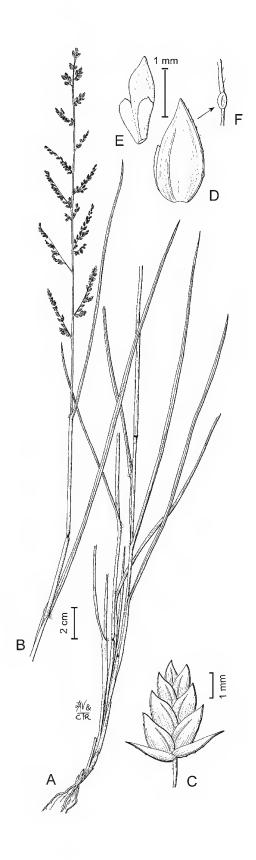

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Lote baldío a un costado del periférico [on edge of waste lot] de la Juventud, Plaza Saucito, Cd. Chihuahua, 22 Sep 2009, A. Melgoza s.n. (CIIDIR, UACH, US).

140. *Eragrostis erosa* Scribn. ex Beal, Grass. N. Amer. 2: 483. 1896.

FIGURE 102

Caespitose perennial; with innovations, not glandular. Culms 70–110 cm tall, erect, glabrous below the nodes. Sheaths overlapping, ½ to about as long as the internodes below, hairy at the apex and sometimes on the upper margins, hairs to 4 mm long, not papillose-based; ligules 0.2–0.4 mm long; blades (8)12–30 cm long, 1.5–3.8 mm wide, flat to involute, abaxial surfaces glabrous, adaxial surfaces scaberulous, glabrous or sparsely hairy, hairs to 4 mm long. Panicles 25–45 cm long, (5)12–30 cm wide, broadly ovate, open; primary branches mostly 4–20 cm

FIGURE 101. Eragrostis echinochloidea. A. Habit. B. Culm and inflorescence. C. Spikelet. D. Floret. E. Palea. F. Gland along midrib. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

long, diverging 20°–90° from the rachises, capillary, sinuous; pulvini glabrous or hairy; pedicels 1–18 mm long, appressed or divergent, proximal spikelets on each branch usually with pedicels shorter than 5 mm long. Spikelets 5–9 mm long, 1–3 mm wide, lanceolate, plumbeous, with 5–12 florets; disarticulation acropetal, glumes first, then the lemmas, paleas persistent; glumes lanceolate to ovate, membranous; lower glumes 1.3–2.4 mm long; upper glumes 1.6–2.6 mm long; lemmas 2.4–3 mm long, ovate, mostly membranous, hyaline near the margins and apex, lateral veins inconspicuous, apex acute; paleas 1.5–3 mm long, hyaline, narrower than the lemmas, apex obtuse to truncate; stamens 3; anthers 0.6–1.7 mm long, purplish. Caryopsis 0.8–1.6 mm long, subellipsoid, terete to somewhat laterally compressed, with a well-developed adaxial groove, faintly striate, opaque, reddish-brown.

DISTRIBUTION AND HABITAT. Eragrostis erosa is native to North America and grows on rocky slopes and hills, often in association with *Pinus edulis*, *Juniperus monosperma*, and *Bouteloua gracilis*, at 1,100–2,300 m. Its range extends from northern Mexico to New Mexico and western Texas.

141. Eragrostis intermedia Hitchc., J. Wash. Acad. Sci. 23(10): 450. 1933.

FIGURE 103

Caespitose perennial; with innovations, not glandular. Culms (30)40-90(110) cm tall, erect, glabrous below the nodes. Sheaths overlapping, ½ to about as long as the internodes below, sparsely pilose on the margins, apex hairy, hairs to 8 mm long, not papillose-based; ligules 0.2-0.4 mm long; blades (4)10-20(30) cm long, 1-3 mm wide, flat or involute, abaxial surfaces glabrous, adaxial surfaces densely hairy behind the ligules, elsewhere usually glabrous, occasionally sparsely hairy. Panicles 15-40 cm long, (8.5)15-30 cm wide, ovate, open; primary branches 4-25 cm long, diverging 20°-90° from the rachises, capillary; pulvini hairy or glabrous; pedicels 2-14 mm long, divergent. Spikelets 3-7 mm long, 1-1.8 mm wide, narrowly lanceolate, olivaceous to purplish, with (3)5-11 florets; disarticulation acropetal, paleas persistent; glumes lanceolate to ovate, hyaline to membranous; lower glumes 1.1-1.7 mm long, narrower than the upper glumes; upper glumes 1.3-2 mm long,

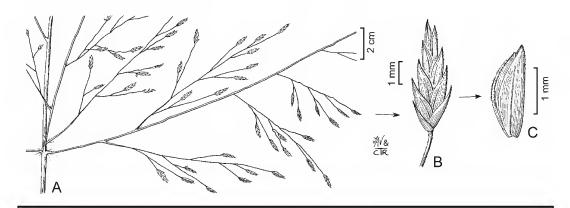

FIGURE 103. Eragrostis intermedia. A. Inflorescence. B. Spikelet. C. Floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

apex acuminate to acute; lemmas 1.6-2.2 mm long, ovate, membranous, hyaline near the margins, lateral veins inconspicuous, apex acute; paleas 1.4-2.1 mm long, hyaline, narrower than the lemmas, apex obtuse to acute; stamens 3; anthers 0.5-0.8 mm long, purplish. Caryopsis 0.5-1.0 mm long, straight angular-prismatic, somewhat laterally compressed, with a well-developed adaxial groove, striate, opaque, reddish-brown. 2n = ca. 54, 60, 72, ca. 74, 80, 100, 120.

DISTRIBUTION AND HABITAT. Eragrostis intermedia is native to the North America and grows in clay, sandy, and rocky soils, often in disturbed sites up to 2,500 m. Its range extends from the United States through Mexico and Central America to South America. Eragrostis intermedia is similar to the more widespread E. lugens, but differs from that species in having wider spikelets, longer lemmas, and caryopsis with a prominent adaxial groove.

142. Eragrostis lehmanniana* Nees, Fl. Afr. Austral. Ill. 402. 1841.

FIGURE 104

Caespitose perennial; forming innovations at the basal nodes, without glands. Culms (20)40-80 cm tall, erect, commonly geniculate, sometimes rooting at the lower nodes, glabrous, lower portions sometimes scaberulous. Sheaths 1/3-2/3 the length of the internodes, sometimes shortly silky pilose basally, hairs less than 2 mm long, apex sparsely hairy, hairs to 3 mm long; ligules 0.3-0.5 mm long, ciliate; blades 2-12 cm long, 1-3 mm wide, flat to involute, glabrous, abaxial surfaces sometimes scaberulous, adaxial surfaces scaberulous. Panicles 7-18 cm long, 2-8 cm wide, oblong, open; primary branches 1-8 cm long, appressed or diverging to 40° from the rachises; pulvini glabrous; pedicels 0.5-4 mm long, diverging or appressed, flexible. Spikelets 5-12(14) mm long, 0.8-1.2 mm wide, linear-lanceolate, plumbeous to stramineous, with 4–12(14) florets; disarticulation irregular to basipetal, paleas usually persistent; glumes oblong to lanceolate, membranous; lower glumes 1-1.5 mm long; upper glumes 1.3-2 mm long; lemmas 1.5-1.7 mm long, ovate, membranous, lateral veins inconspicuous, apex acute to obtuse; paleas 1.4-1.7 mm long, obtuse; stamens 3; anthers 0.6-0.9 mm long, yellowish. Caryopsis 0.6-0.8 mm long, ellipsoid to obovoid, dorsally compressed, sometimes with a shallow adaxial groove, smooth, translucent, mostly light brown, embryo region dark brown with a greenish ring. 2n = 40, 60.

DISTRIBUTION AND HABITAT. Eragrostis lehmanniana is introduced in North America and native to southern Africa, where it grows in sandy, savannah habitats. In North America, it grows in sandy flats, along roadsides, on calcareous slopes, and in disturbed areas at 1,500–2,300 m. It is commonly found in association with Larrea tridentata, Opuntia, Quercus, Juniperus, and Bouteloua gracilis.

143. Eragrostis lugens Nees, Fl. Bras. Enum. Pl. 2: 505-506. 1829.

FIGURE 105

Caespitose perennial; with innovations, not glandular. Culms (20)30–50(60) cm tall, erect, sometimes geniculate, glabrous below the nodes. Sheaths overlapping, ½–¾3 as long as the internodes above, mostly glabrous, apex hairy, hairs 2–5 mm long, papillose-based, this sometimes not readily seen; ligules 0.2–0.3 mm long; blades (4)8–22 cm long, 1–3.5 mm wide, involute to flat, both surfaces glabrous, margins sometimes with scattered hairs, hairs to 7 mm long. Panicles 16–28 cm long, 10–21 cm wide, ovate, open; primary branches 0.6–15 cm long, diverging up to 100° from the rachises, naked basally; pulvini hairy; pedicels 1.4–5(7) mm long, diverging, wiry, present on all spikelets. Spikelets 2–4.5(5) mm long, 0.5–1(1.3) mm wide, narrowly lanceolate, plumbeous to reddish-purple, with 2–7 florets; disarticulation acropetal, paleas persistent; glumes broadly ovate to narrowly lanceolate, hyaline, sometimes

reddish-purple; lower glumes 0.6-1 mm long; upper glumes 1.1-1.4 mm long, usually broader than the lower glumes; lemmas 1.2-1.6 mm long, broadly ovate, mostly membranous but the distal margins hyaline, lateral veins inconspicuous, apex acute; paleas 1.1-1.7 mm long, membranous to hyaline, apex obtuse; stamens 3; anthers 0.2-0.7 mm long, reddish-purple. Caryopsis 0.5-0.6 mm long, obovoid to somewhat prismshaped, terete to somewhat laterally compressed, with an adaxial groove, finely striate, usually opaque, faintly reddish-brown to whitish. 2n = 40, 80, ca. 108.

DISTRIBUTION AND HABITAT. Eragrostis lugens is native to North America and grows in montane areas along roadsides and waste places up to 2,500 m. Its range extends from the southern United States to Peru and Argentina.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: km 52 carr. [hwy] Chihuahua–Cd. Juárez, 3 Aug 1978, pastizal [pastureland], 1450 m, *I.D. Enríquez, Delgadillo, Molinar 7*, 12 (MEXU).

144. *Eragrostis mexicana* (Hornem.) Link, Hort. Berol. 1: 190. 1827.

Caespitose annual; without innovations. Culms 10–130 cm tall, erect, sometimes geniculate, glabrous, sometimes with a ring of glandular depressions below the nodes. Sheaths $\frac{1}{2}$ – $\frac{2}{3}$ as long as the internodes, sometimes with glandular pits, pilose near the apex and on the collars, hairs to 4 mm long, papillose-based; ligules 0.2–0.5 mm long, ciliate; blades 5–25 cm long, 2–7(9) mm wide, flat, abaxial surfaces glabrous, adaxial surfaces scaberulous, occasionally pubescent near the base. Panicles (5)10–40 cm long, (2)4–18 cm wide, less than $\frac{1}{2}$ the height of the plant, ovate,

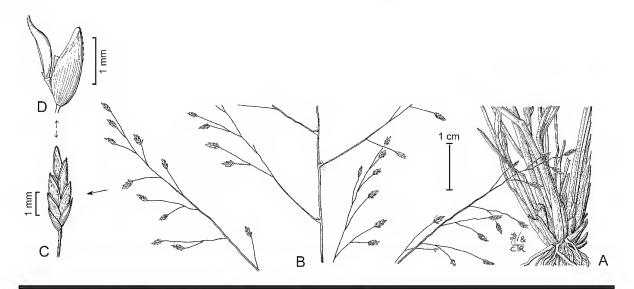

FIGURE 105. Eragrostis lugens. A. Habit. B. Inflorescence. C. Spikelet. D. Floret and palea above. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

rachises angled and channeled; primary branches 3–12(15) cm long, solitary to whorled, appressed or diverging to 80° from the rachises; secondary branches somewhat appressed; pulvini glabrous; pedicels 1–6(7) mm long, almost appressed to narrowly divergent, stiff. Spikelets (4)5–10(11) mm long, 1.5–2.4 mm wide, ovate to oblong, gray-green to purplish, with 5–11(15) florets; disarticulation acropetal; glumes 1.2–2.3 mm long, subequal, ovate to lanceolate, membranous; lemmas 1.2–2.4 mm long, ovate, membranous, glabrous or with a few hairs, gray-green, lateral veins evident, often greenish, apex acute; paleas

1–2.2 mm long, hyaline, keels scabrous, apex obtuse to truncate; stamens 3; anthers 0.2–0.5 mm long, purplish. Caryopsis 0.5–0.8(1) mm long, ovoid to straight angular-prismatic, laterally compressed, shallowly to deeply grooved on the adaxial surface, striate, reddish-brown, distal $\frac{2}{3}$ opaque. 2n = 60.

DISTRIBUTION AND HABITAT. Eragrostis mexicana is native to North America and grows along roadsides, near cultivated fields, and in disturbed open areas at 100–3,000 m.

Two subspecies, *E. mexicana* subsp. *virescens* and *E. mexicana* subsp. *mexicana*, occur in the study area.

KEY TO SUBSPECIES OF ERAGROSTIS MEXICANA

- 1. Spikelets up to 1.5 mm wide, linear to linear-lanceolate; lower glume 0.7–1.7 mm long E. mexicana subsp. virescens

Eragrostis mexicana subsp. mexicana.

FIGURE 106

DISTRIBUTION AND HABITAT. Eragrostis mexicana subsp. mexicana grows from Ontario through the midwestern United States to California, South Carolina, and Texas and southward to Mexico, Central America, and northern South America to Argentina.

Eragrostis mexicana subsp. virescens (J. Presl) S. D. Koch & Sánchez Vega, Phytologia 58: 380. 1985.

DISTRIBUTION AND HABITAT. Native from Canada, United States, Mexico, and South America. In Mexico it is found in Baja California, Baja California Sur, and Chihuahua (Espejo Serna et al., 2000).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

145. Eragrostis palmeri S. Watson, Proc. Amer. Acad. Arts 18: 182. 1883.

FIGURE 107

Caespitose perennial; with innovations and knotty bases, not glandular. Culms 50-90(120) cm tall, glabrous below the nodes. Sheaths overlapping, ½ to about as long as the internodes below, villous and the hairs not papillose-based, or mostly glabrous, apex hairy, hairs to 5 mm long; ligules 0.2-0.4 mm long; blades (14)20-35 cm long, 1-2.4 mm wide, involute, abaxial surfaces glabrous, adaxial surfaces scaberulous, sometimes sparsely hairy. Panicles 12-40 cm long, 4-20 cm wide, oblong, open; primary branches 2-20 cm long, diverging 20°-70° from the rachises, capillary; pulvini glabrous or sparsely hairy; pedicels (0.4)1-4(14) mm long, appressed or diverging, only the terminal pedicels on each branch longer than 4 mm long. Spikelets 4-6(7.3) mm long, 1-2 mm wide, linear-lanceolate, plumbeous, with 5-12 florets; disarticulation acropetal, paleas persistent; glumes lanceolate to ovate, hyaline; lower glumes 1.1-1.8 mm long; upper glumes 1.2-2.2 mm long, exceeded by the basal lemmas; lemmas 2-2.6 mm long, ovate, membranous, hyaline toward the apex and margins, keels weak or strong, without glands, lateral veins from inconspicuous to conspicuous, apex acute; paleas 1.7-2.4 mm long, hyaline, bases not projecting beyond the lemmas, apex truncate, often notched; stamens 3; anthers 0.6-1.3 mm long, yellowish to purplish. Caryopsis 0.6-0.8 mm long, straight angular-prismatic to subellipsoid, laterally compressed, with a well-developed adaxial groove, faintly striate, opaque, reddish-brown. 2n = 40.

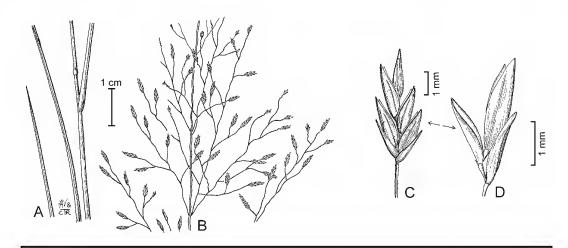

FIGURE 107. Eragrostis palmeri. A. Culm, sheath, and blade. B. Inflorescence. C. Spikelet. D. Two paleas below floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

DISTRIBUTION AND HABITAT. Eragrostis palmeri is native to North America and grows on rocky slopes and hills generally in association with *Pinus*, *Juniperus*, *Bouteloua gracilis*, and *Prosopis* at 300–2,150 m. Its range extends from the southwestern United States to Oaxaca.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Aldama: Rancho El Morrion, acceso [access] de Aldama hacia [toward] Ojinaga, desviar [divert] en km 55 a la derecha [to right] 5 km por terracería [dirt road], 25 Oct 2000, matorral [scrub], G. Gómez 632 (MEXU). Mpio.?: Sierra de los Pinos, Dec 1937, LeSueur 0219 (US).

146. Eragrostis pectinacea (Michx.) Nees, Fl. Afr. Austral. Ill. 406, 1841.

Caespitose annual; without innovations, without glandular pits. Culms 10–80 cm tall, erect to geniculate or decumbent below, glabrous. Sheaths overlapping below, ½–¾ as long as the internodes above, hirsute at the apex, hairs to 4 mm long; ligules 0.2–0.5 mm long; blades 2–20 cm long, 1–4.5 mm wide, flat to involute, abaxial surfaces glabrous and smooth, adaxial surfaces scaberulous. Panicles 5–25 cm long, 3–12(15) cm wide, ovoid to pyramidal, usually open, sometimes contracted;

primary branches 0.6–8.5 cm long, appressed or diverging to 80° from the rachises, solitary or paired at the lowest 2 nodes; pulvini glabrous or sparsely hairy; pedicels 1-7 mm long, flexible, appressed to widely divergent, sometimes capillary. Spikelets 3.5-11 mm long, 1.2-2.5 mm wide, linear-oblong to narrowly lanceolate, plumbeous, yellowish-brown or dark reddish-purple, with 6-22 florets; disarticulation acropetal, paleas persistent; glumes subulate to ovate-lanceolate, hyaline; lower glumes 0.5-1.5 mm long, at least ½ as long as the adjacent lemmas; upper glumes 1–1.7 mm long, usually broader than the lower glumes; lemmas 1-2.2 mm long, ovate-lanceolate, hyaline to membranous, gravish-green proximally, reddish-purple distally, lateral veins moderately conspicuous, apex acute; paleas 1-2 mm long, hyaline to membranous, keels scaberulous, apex obtuse; stamens 3; anthers 0.2-0.4 mm long, purplish. Caryopsis 0.5-1.1 mm long, pyriform, slightly laterally compressed, smooth, faintly striate, brownish. 2n = 60.

DISTRIBUTION AND HABITAT. Eragrostis pectinacea is native from southern Canada to Argentina. It grows in disturbed sites such as roadsides, railroad embankments, gardens, and cultivated fields up to 2,400 m. Two varieties occur in Chihuahua.

KEY TO VARIETIES OF ERAGROSTIS PECTINACEA

Eragrostis pectinacea var. miserrima (E. Fourn.) Reeder, Phytologia 60(2): 154. 1986.

Pedicels widely divergent, usually spreading 20°-60° from the branches.

DISTRIBUTION AND HABITAT. Eragrostis pectinacea var. miserrima grows in the southern United States, from Texas to Florida, and south throughout Mexico to the lowland tropics of Brazil.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Casas Grandes: Between Casas Grandes and Sabinal, 4–5 Sep 1899, E.W. Nelson 6353 (US). Chihuahua: N of Chihuahua, 20 Oct 1935, LeSueur Mex-078 (MEXU, US). 147. Eragrostis pilosa* (L.) P. Beauv., Ess. Agrostogr. 71: 162, 175. 1812. Poa pilosa L., Sp. Pl. 1: 68. 1753.

FIGURE 109

Caespitose annual; without innovations. Culms 8–45(70) cm tall, erect or geniculate, glabrous, occasionally with a few glandular depressions. Sheaths overlapping below, about ½ as long as the internodes, mostly glabrous, occasionally glandular, apex hirsute, hairs to 3 mm long; ligules 0.1-0.3 mm long, ciliate; blades 2-15(20) cm long, 1-2.5(4) mm wide, flat, abaxial surfaces glabrous, occasionally with glandular pits along the midrib, adaxial surfaces scaberulous. Panicles 4-20(28) cm long, 2-15(18) cm wide, ellipsoid to ovoid, diffuse; primary branches 1-10 cm long, diverging 10°-80°(110°) from the rachises, capillary, whorled on the lowest 2 nodes, rarely glandular; pulvini glabrous or hairy; pedicels 1-10 mm long, flexible, appressed or divergent. Spikelets (2)3.5-6(10) mm long, 0.6-1.4 mm wide, linear-oblong to narrowly ovate, plumbeous, with (3)5-17 florets; disarticulation acropetal, paleas tardily deciduous, rachillas persisting longer than the paleas; glumes narrowly ovate to lanceolate, hyaline; lower glumes 0.3-0.6(0.8) mm long; upper glumes 0.7-1.2(1.4) mm long; lemmas 1.2-2 mm long, ovate-lanceolate, membranous to hyaline, grayish-green proximally, reddish-purple distally, lateral veins inconspicuous, apex acute; paleas 1-1.6 mm long, membranous to hyaline, keels scaberulous to scabrous, apex obtuse; stamens 3; anthers 0.2-0.3 mm long, purplish. Caryopsis 0.5-1 mm long, obovoid to prism-shaped, adaxial surfaces flat, smooth to faintly striate, light brown. 2n = 40.

SPECIMENS EXAMINED. MEXICO. Chihuahua. E. Palmer 507 (MEXU); Gentry 1854 (MEXU).

148. Eragrostis pringlei Mattei, Contr. Biol. Veg. 4: 241. 1909.

Caespitose annual. Culms 10–25 cm tall. Sheaths papillose-hirsute, hairy at the collar; ligules 0.3–0.4 mm long; blades 1.5–5 cm long, 1–4 mm wide, generally wider toward base, densely papillose-hirsute. Panicles 7–10 cm long, 0.5–2.5 cm wide, oblong-ellipsoid, pedicels 1.8–2.5 mm long, with a glandular ring in the central part. Spikelets 1.7–2.3 mm long, ovate, with 2–3(5) florets; glumes unequal, shorter than lemma, lower glumes 0.5–0.8 mm long, upper glumes 0.8–1.1 mm; lemmas 1–1.4 mm long, inconspicuously veined, dark at maturity; palea 0.9–1.2 mm long, persistent. Caryopsis subglobose, ca. 0.5 mm long, minutely striate, the surface with a crustaceous layer.

DISTRIBUTION AND HABITAT. Eragrostis pringlei is native to North America and grows in prairies, limestone mesas, oak forest, and grasslands at 2,000–2,200 m, often in association with *Prosopis*. It is found in the following states of

149. Eragrostis secundiflora J. Presl, Reliq. Haenk. 1(4–5): 276. 1830.

FIGURE 110

Caespitose perennial; with innovations, not glandular. Culms 30–75 cm tall, erect, glabrous below. Sheaths overlapping below, ½ as long as the internodes above, mostly glabrous, hairy at the apex, hairs to 4 mm long; ligules 0.2–0.3 mm long; blades 10–25(40) cm long, 1–5 mm wide, involute, glabrous abaxially, scaberulous adaxially, sometimes also sparsely pilose. Panicles (3)5–30 cm long, 1–15 cm wide, from narrowly

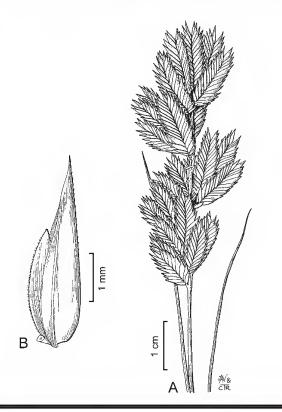

FIGURE 110. *Eragrostis secundiflora* subsp. o*xylepis* (Torr.) S.D. Koch. A. Inflorescence. B. Floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

oblong, glomerate, and interrupted below to ovate and open; primary branches 0.5-12(16) cm long, appressed or diverging up to 40° from the rachises, stiff; pulvini glabrous or sparsely hairy; pedicels 0-1(3) mm long, appressed, flattened. Spikelets 6-16(23) cm long, 2.4-5 mm wide, ovate to linear-elliptic, flattened, stramineous, with reddish-purple margins or completely reddish-purple, with 10-45 florets; disarticulation basipetal, florets falling intact and before the glumes; glumes ovate-lanceolate to lanceolate, membranous; lower glumes 1.7-3 mm long; upper glumes 2.2-4 mm long, apex acuminate; lemmas 2-6 mm long, ovate, membranous to leathery, apex usually acuminate or attenuate, sometimes acute; paleas 1.5-3 mm long, membranous to leathery, narrower than the lemmas, apex obtuse, sometimes bifid; stamens 2; anthers 0.2-0.5 mm long, brownish. Caryopsis 0.8-1.3 mm long, ellipsoid, somewhat laterally flattened, smooth, reddish-brown. 2n = 40.

DISTRIBUTION AND HABITAT. There are two subspecies of *E. secundiflora*; plants from Chihuahua belong to *Eragrostis secundiflora* subsp. *secundiflora*. It is native to North America and grows in sandy soils, dunes, grasslands, beaches, and roadsides up to 1,000 m. The range of *E. secundiflora* extends into southern United States and Mexico in Campeche, Chiapas, Chihuahua, Guerrero, Jalisco, Nayarit, Oaxaca, Quintana Roo, Tabasco, Tamaulipas, Veracruz, and the Yucatán.

FIGURE 111

Caespitose perennial; with innovations, not glandular. Culms 30-90 cm tall, erect or decumbent, glabrous below the nodes. Sheaths overlapping below, ½ to as long as the internodes above, hairy at the apex and on the collars, sometimes also on the distal portion of the margins, hairs to 5 mm; ligules 0.4–0.5 mm long; blades 5–30 cm long, 1–3 mm wide, usually involute, sometimes flat, abaxial surfaces glabrous or sparsely pilose, hairs to 5 mm long, adaxial surfaces scaberulous. Panicles 20-65 cm long, 10-35 cm wide, ovate, open; primary branches 2–20(24) cm long, widely spaced, diverging 20°–100° from the rachises, not rebranched, naked basally; pulvini hairy; pedicels 0-12 mm long, appressed, proximal spikelets on each branch sessile or subsessile, the pedicels shorter than 0.4 mm. Spikelets 5-13 mm long, 1.4-3 mm wide, oblong to oblanceolate, stramineous to reddish-purple, with 3-12 florets; disarticulation tardy, basipetal, in the rachilla below the florets, glumes persistent; glumes lanceolate, broad basally, indurate; lower glumes 2.5-6 mm long; upper glumes 3-6 mm long, apex acuminate; lemmas 3–5 mm long, narrowly ovate to lanceolate, indurate, apex acuminate; paleas 2.4-4.6 mm long, indurate, gibbous basally but the sides not projecting beyond the lemmas, keels ciliolate, apex obtuse; stamens 3; anthers 0.3-0.5 mm long, reddish-brown. Caryopsis 0.9-1.5 mm long, ovoid to

pyriform, laterally flattened, tapering distally, smooth to faintly striate, brownish. 2n = 40.

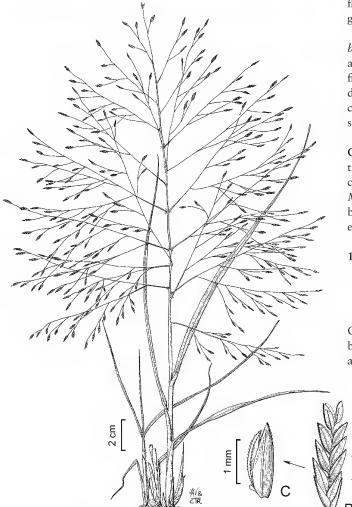

DISTRIBUTION AND HABITAT. Eragrostis sessilispica is native from the United States and grows in prairies, limestone mesas, thorn forest openings, and grasslands, generally in sandy soils, at 0–300 m, often in association with *Prosopis* and *Quercus*. Its range extends into Texas, New Mexico, Oklahoma, and Kansas to Chihuahua and Tamaulipas.

151. Eragrostis spectabilis (Pursh) Steud., Nomencl. Bot. (ed. 2) 1: 564. 1840.

FIGURE 112

Caespitose perennial; with innovations and short, knotty rhizomes less than 4 mm thick. Culms 30–70(85) cm tall, erect

to ascending, often sprawling, glabrous. Sheaths overlapping, hairy on the margins and at the apex, hairs to 7 mm long; ligules 0.1-0.2 mm long; blades 10-32 cm long, 3-8 mm wide, flat to involute, both surfaces usually pilose, sometimes glabrous on both surfaces or glabrous abaxially and sparsely pilose adaxially, often with a line of hairs behind the ligules, hairs to 8 mm long. Panicles (15)25-45(60) cm long, 15-35 cm wide, broadly ovate to oblong, open, basal portions sometimes included in the uppermost sheaths; primary branches (6)12-20 cm long, diverging 20°-90° from the rachises, capillary, naked below; pulvini hairy, hairs to 6 mm; pedicels 1.5-17 mm long, divergent or appressed. Spikelets 3-7.5 mm long, 1-2 mm wide, linear-lanceolate, reddish-purple, sometimes olivaceous, with (4)6-12 florets; disarticulation basipetal, glumes persistent; glumes (1)1.3-2.3 mm long, subequal to equal, lanceolate, membranous to chartaceous; lemmas (1)1.3-2.5 mm long, ovate to lanceolate, leathery, 3-veined, apex acute; paleas (1)1.2–2.4 mm long, membranous, keels sometimes shortly ciliate, apex obtuse to truncate; stamens 3; anthers 0.3-0.5 mm long, purplish. Caryopsis 0.6-0.8 mm long, ellipsoid, strongly flattened, adaxial surfaces with 2 prominent ridges separated by a groove, reddish-brown. 2n = 20, 40, 42.

DISTRIBUTION AND HABITAT. Eragrostis spectabilis is native in North America, extending from southern Canada through the United States, Mexico, and Belize. It grows in fields and on the margins of woods, along roadsides, and in other disturbed sites, usually in sandy to clay loam soils, and is associated with hardwood forests, *Prosopis–Acacia* grasslands, and short grass prairies at 0–1,000 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. long; blades 7-30 cm long, 2.5-7 mm wide, flat to loosely involute, glabrous abaxially, scabrous adaxially, margins sharply scabrous. Panicles 10-30 cm long, 1-6 cm wide, oblong, condensed, interrupted below; primary branches 1-11 cm long, appressed or diverging to 40° from the rachises, naked basally; pulvini glabrous; pedicels 0.5-25 mm long, with a narrow band or abscission line below the apex. Spikelets 5.5-16 mm long, 2.7-9 mm wide, ovate, flattened, greenish to stramineous, sometimes with a reddish-purple tinge, with 4-22 florets; disarticulation below the glumes, spikelets falling intact; glumes 3–4.5 mm long, equal, ovate, chartaceous; lemmas 3-5 mm long, broadly lanceolate, chartaceous to leathery, lateral veins green, apex acute; paleas 3-5 mm long, chartaceous to hyaline, keels broadly winged below, forming a wing or tooth on each side that often projects beyond the lemma bases, apex acuminate; stamens 3; anthers 1.4-2.8 mm long, golden-yellow. Caryopsis 1-2 mm long, ellipsoid, adaxial surfaces flattened, reddish-brown. 2n = 40.

DISTRIBUTION AND HABITAT. Eragrostis superba is introduced to North America and native to Africa, where it is grown for hay, being fairly palatable and drought resistant. It is also used for erosion control and re-vegetation. It grows on rocky slopes, in sandy flats, and along roadsides, often with Acacia, Prosopsis, Fouquieria splendens, Juniperus, and Quercus, at 480–1,900 m.

Eriochloa Kunth

Annual or perennial; caespitose, sometimes with short rhizomes or stolons, not producing subterranean spikelets. Culms 20-250 cm tall, erect or decumbent, usually with 2-5 nodes. Sheaths open; auricles absent; ligules membranous, ciliate. Inflorescences terminal, panicles of spikelike branches on elongate rachises; branches with many pedicellate, loosely appressed spikelets, terminating in a spikelet, without stiff bristles or flat bracts, spikelets in pairs, triplets, or solitary, often solitary distally when in pairs or triplets at the middle of the branches; pedicels terminating in a well-developed disk; disarticulation below the glume(s). Spikelets with 2 florets, lower florets usually sterile, upper florets bisexual. Lower glumes typically reduced (sometimes absent) and fused with the glabrous callus to form a cuplike structure; upper glumes lanceolate to ovate, glabrous or variously pubescent, 3- to 9-veined, unawned or awned; lower lemmas similar to the upper glumes in length, shape, venation,

and pubescence, unawned; lower paleas absent to fully developed; upper lemmas lanceolate to ovate, indurate, rugose, dull, glabrous, rounded on the back, veins not pronounced, margins involute; anthers 3; lodicules 2, papery; styles with 2 branches,

purple, plumose. Caryopsis not longitudinally grooved; endosperm solid. x = 9.

Eriochloa, a genus of about 37 species, grows in tropical, subtropical, and warm-temperate areas of the world.

KEY TO SPECIES OF ERIOCHLOA

153. *Eriochloa acuminata* (J. Presl.) Kunth, Enum. Pl. 1: 72. 1833. *Piptatherum acuminatum* J. Presl, Rel. Haenk. 1(4–5): 221. 1830.

Eriochloa gracilis (E. Fourn.) Hitchc., J. Wash. Acad. Sci. 23: 455. 1933.

Caespitose annual. Culms 30–120 cm long, erect or decumbent, sometimes rooting at the lower nodes; internodes glabrous or with scattered hairs; nodes glabrous or pilose. Sheaths sometimes conspicuously inflated, glabrous or pubescent; ligules 0.2–1.2 mm long; blades 5–12(18) cm long, (2)5–12(16) mm wide, linear, flat or folded, straight or lax, glabrous or sparsely pubescent adaxially. Panicles 7–16 cm long, 1–6 cm wide, loosely contracted; rachises scabrous or hairy; branches 5–20, 1–5 cm long, 0.4–0.6 mm wide, appressed to divergent, pubescent, sometimes setose, not winged, with 20–36 spikelets, spikelets mostly in

unequally pedicellate pairs, solitary distally; pedicels 0.1-1 mm long, hairy. Spikelets 3.8-5(6) mm long, 1.1-1.4 mm wide, lanceolate to ovate. Lower glumes absent; upper glumes equaling the lower lemmas, lanceolate to ovate, hairy, 5(7)-veined, acuminate to acute, unawned or awned, awns to 1.2 mm; lower lemmas 3.6-5 mm long, 1.1-1.4 mm wide, lanceolate to ovate, setose, 5(7)-veined, acuminate to acute, unawned; lower paleas absent; anthers absent; upper lemmas 2.3-3.3 mm long, 0.7-0.9 times as long as the lower lemmas, indurate, elliptic, rounded, 5-veined, mucronate, the mucros 0.1-0.3 mm long; upper paleas indurate, blunt, rugose. 2n=36.

DISTRIBUTION AND HABITAT. Eriochloa acuminata is native to the southern United States and northern Mexico and has become established outside this region.

FIGURE 115

Caespitose annual. Culms 20–100 cm tall, erect or decumbent, sometimes rooting at the lower nodes; internodes pilose or pubescent; nodes pubescent to puberulent. Sheaths sparsely to densely pubescent; ligules 0.4–1.1 mm long; blades 6–12(22) cm long, 2–8 mm wide, linear, flat to conduplicate, straight, appressed to divergent, both surfaces sparsely to densely pubescent with short, evenly spaced hairs. Panicles 6–20 cm long, 0.3–1.2 cm wide; rachises pilose, longer hairs 0.1–0.8 mm; branches

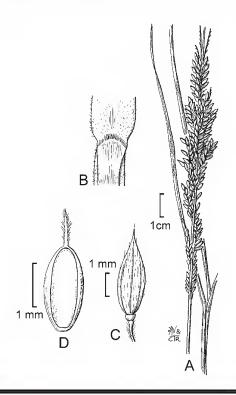

FIGURE 115. *Eriochloa contracta*. A. Inflorescence and leaf blades. B. Ligule. C. Spikelet. D. Upper floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

10–20(28), 15–45(60) mm long, 0.2–0.4 mm wide, appressed, pubescent to setose, not winged, with 8–16 mostly solitary spikelets, occasionally paired at the base of the branches; pedicels 0.2–1 mm long, variously hirsute below, apex with fewer than 10 hairs more than 0.5 mm long. Spikelets (3.1)3.5–4.5(5) mm long, 1.2–1.7 mm wide, lanceolate; upper glumes as long as the lower lemmas, with sparsely appressed pubescence on the lower $\frac{2}{3}$, scabrous or glabrous distally, 3- to 9-veined, acuminate and awned, awns 0.4–1 mm; lower florets sterile; lower lemmas 3–4.3 mm long, 1.2–1.7 mm wide, lanceolate, setose, 3- to 7-veined, acuminate, unawned or mucronate; lower paleas absent; upper lemmas 2–2.5 mm long, indurate, elliptic, 5- to 7-veined, acute to rounded and mucronate to awned, mucro/awns 0.4–1.1 mm long; upper paleas indurate, faintly rugose, blunt. 2n = 36.

DISTRIBUTION AND HABITAT. Eriochloa contracta grows in fields, ditches, and other disturbed areas. It is native and common in the central United States and adventive to the east and southwest.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 16.1 km W of Balleza and 77.9 km E of Guachochi, 18 Sep 1991, bosque de encino [oak forest], 1990 m, *P.M. Peterson, Annable & Valdés-Reyna* 10744 (CIIDIR).

156. *Eriochloa lemmonii* Vasey & Scribn., Bot. Gaz. 9(12): 185, pl. 2. 1884.

FIGURE 116

Caespitose annual. Culms 20-80 cm tall, erect or decumbent, sometimes rooting at the lower nodes; internodes densely pubescent to pilose; nodes pubescent to pilose. Sheaths from conspicuously inflated to not inflated, glabrous or pubescent to pilose; ligules 0.5-1 mm long; blades 5-15 cm long, 6-20 mm wide, lanceolate, flat, straight, diverging or ascending, velvety pubescent adaxially. Panicles 5-15 cm long, 0.5-4 cm wide, spreading or contracted; rachises hairy; branches (2)3-8(10), 1-4 cm long, 0.4–0.6 mm wide, appressed or reflexed and spreading, velvety pubescent, not winged, with 10-14 spikelets, spikelets in unequally pedicellate pairs at the middle of the branches, solitary distally; pedicels 0.5–1 mm long, pilose, apex hairy or glabrous. Spikelets 3-4.5(4.9) mm long, 1.2-1.7 mm wide, elliptic; upper glumes equaling the lower lemmas, nearly glabrous or sparsely to densely pilose, elliptic, 5- to 7-veined, acute, unawned; lower lemmas 2.7-4 mm long, 1.2-1.7 mm wide, elliptic, setose to pilose, 5-veined, acute, unawned; lower paleas 1-4 mm long, hyaline; anthers absent or 3; upper lemmas 2.3-3.3 mm long, elliptic, indurate, dull, rough, occasionally with a few long hairs, acute to rounded, sometimes mucronate; upper paleas indurate. 2n = 36.

DISTRIBUTION AND HABITAT. Eriochloa lemmonii, a rare species, grows in canyons and on rocky slopes in Pima County, Arizona, Hidalgo County, New Mexico, and adjacent Mexico.

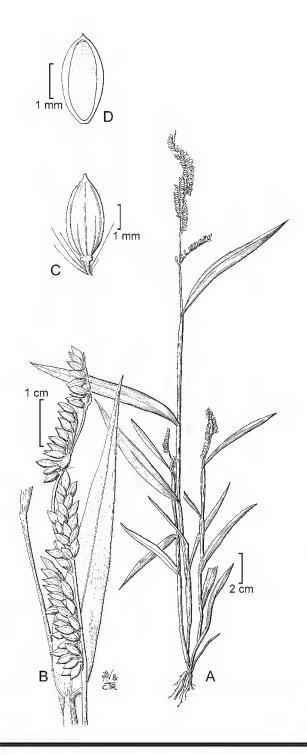

FIGURE 116. *Eriochloa lemmonii*. A. Habit. B. Inflorescence and leaf blade. C. Spikelet. D. Upper floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: SW Chihuahua, Aug 1885, E. Palmer 110-A (US); Intersección Arroyo de Santiago con el Río Batopilas, 6 km antes del pueblo [before town] de Batopilas, 10 Sep 1999, 600 m, T. Lebgue, G. Quintana & E. Estrada 2362 (NMC). Ocampo: Ca 1 km W of W boundary of Parque Nacional "Cascada de Basaseachic," 18 km from the Cahuisori–Ocampo road on the road to Candamena, 7.5 km below Cruz, 24 Sep 1994, 1260 m, Spellenberg, Corral & Estrada 12193 (NMC).

Eriochloa nelsonii Scribn. & J. G. Sm., Bull. Div. Agrostol. U.S.D.A. 4: 12–13. 1897.

Annual. Culms 30–150 cm tall, erect or decumbent, pubescent. Sheaths pilose; ligule 0.3–1.5 mm long, a ring of hairs; blades 7–19 cm long, 5–17 mm wide, flat, pilose. Inflorescence 6–12 cm long, 1.5–4 cm wide, main axis pilose, branches 1.2–3.5 cm long, (1)3–7(10) per culm with 10–40 spikelets per branch, divergent from rachis, the branches with hairs 3–8 mm long. Spikelets 5–8 mm long, 1.5–2 mm wide, lanceolate, in pairs; upper glumes equaling the lower lemmas, lanceolate, 5- to 9-veined, pilose, glabrous toward the apex, acute to obtuse, muticous; lower lemma 4.8–7.8 mm long, 1.5–2 mm wide, lanceolate, 5(7)-veined, pilose, glabrous toward the apex, acute and muticous; palea vestigial or absent; upper lemma 3.2–4.4 mm long, 5-veined, acute to rounded or acute with a small mucro. 2n = 18, 36.

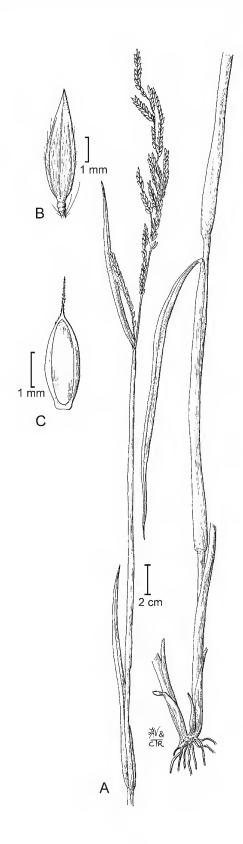

DISTRIBUTION AND HABITAT. Eriochloa nelsonii has two varieties; only Eriochloa nelsonii var. nelsonii is present in Chihuahua. It ranges from Mexico to Central America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000).

158. Eriochloa punctata (L.) Desv. ex Ham., Prodr. Pl. Ind. Occid. 5. 1825.

FIGURE 117

Perennial; rhizomatous, often flowering the first year and resembling an annual. Culms 30–150 cm tall, erect or decumbent, not rooting at the lower nodes; internodes glabrous; nodes 3–10, glabrate. Sheaths occasionally inflated, glabrous (rarely puberulent), often purplish at maturity; ligules 0.4–1 mm long; blades 10–50 cm long, (2)4–10(13) mm wide, linear, flat, straight, spreading, glabrous (rarely puberulent) on both surfaces. Panicles 9–22 cm long, 1–10 cm wide, contracted, rarely open; rachises scabrous to densely pubescent; branches (4)8–20(27), 1–6 cm long, 0.3–0.5 mm wide, appressed or divergent, glabrous, not winged, with 28–60 spikelets, spikelets mostly in unequally pedicellate pairs, solitary distally; pedicels 0.1–0.7 mm long, uniformly pubescent, hairs about 0.1 mm. Spikelets (4)4.5–5.7 mm long, 0.9–1.4 mm wide; upper glumes equaling the lower lemmas,

lanceolate, sparsely appressed pilose, 5- to 7-veined, acuminate, sometimes mucronate, mucro shorter than 0.5 mm; lower lemmas 4.3-5.5 mm long, 0.9-1.4 mm wide, lanceolate, setose, 5- to 7-veined, acuminate, unawned or mucronate; lower paleas absent; anthers absent; upper lemmas 2-3.5 mm (excluding the awn), 0.4-0.6 times as long as the lower lemmas, indurate, elliptic, 5-veined, rounded, awned, awns 0.6-1.5 mm long; upper paleas 0.5-1.2 mm long, indurate, blunt. 2n = 36.

DISTRIBUTION AND HABITAT. Eriochloa punctata grows in coastal marshes, along water courses, and in moist swales and ditches of the coastal plain from Texas and Louisiana south through Mexico to Central and South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Camargo: 20 km S of Camargo, 2 Aug 1939, 1220 m, *L. H. Harvey 1385* (ENCB, US); 5 km W of Cd. Camargo, 5 Aug 1939, *L. H. Harvey 1416* (US). Peterson & Annable 8097* (US).

Erioneuron Nash

Perennial; usually caespitose, occasionally stoloniferous. Culms 6-65 cm long, erect. Leaves mostly basal; sheaths smooth, glabrous, striate, margins hyaline, collars with tufts of 1-3 mm hairs; blades usually folded, pilose basally, margins white, cartilaginous, apex acute but not sharp. Inflorescences terminal, simple panicles (racemes in depauperate specimens), exserted well above the leaves. Spikelets laterally compressed, with 3-20 florets, distal florets staminate or sterile; disarticulation above the glumes and between the florets. Glumes thin, membranous, 1-veined, acute to acuminate; calluses with hairs; lemmas rounded on the back, 3-veined, veins conspicuously pilose, at least basally, apex toothed or obtusely 2-lobed, midveins often extended into awns, awns to 4 mm long, lateral veins sometimes extended as small mucros; paleas shorter than the lemmas, keels ciliate, intercostal regions pilose basally; lodicules 2, adnate to the bases of the paleas; anthers 1 or 3. Caryopsis glossy, translucent; embryos more than ½ as long as the carvopsis. x = 8.

Erioneuron is an American genus of three species, all in Chihuahua.

FIGURE 117. Eriochloa punctata. A. Habit. B. Spikelet. C. Upper floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

KEY TO SPECIES OF ERIONEURON

- 1. Lemmas 2-lobed, with a cleft of 1–2.5 mm deep, central veins extended into an awn 1–4 mm long; glumes (at least the upper) as long as or longer than the inferior florets.
- 159. Erioneuron avenaceum (Kunth) Tateoka, Amer. J. Bot. 48(7): 572. 1961. Triodia avenacea Kunth, Nov. Gen. Sp. (quarto ed.)1: 156. T. 48. 1815. Tridens avenaceus (Kunth) Hitchc., Contr. U.S. Natl. Herb. 17(3): 357. 1913.

Erioneuron avenaceum var. grandiflorum (Vasey) Gould.

FIGURE 118

Culms (7)10-30(40) cm tall, (0.4)0.7-1 mm thick, glabrous; nodes glabrous or villous. Ligules to 0.5 mm long; blades (1.5)3-5(8) cm long, (0.5)1-1.5(2.5) mm wide, both surfaces sparsely pilose. Panicles 2-8(10) cm long; branches with 2-10(16) shortly pedicellate spikelets. Spikelets 6-8(10) mm long, purplish, with (4)6-12(20) florets; lower glumes 4-7 mm long; upper glumes 6-9 mm long, equaling or exceeding the lowest florets; lemmas 4-7 mm long, purplish-green, awned from between the lobes, awns 2-4 mm long, apex bilobed, lobes 1-2 mm long, obtuse to acute; anthers 0.4-1 mm long or (when monandrous) to 1.3 mm long. Caryopsis 1-1.4 mm long, 2n = 16, 32.

DISTRIBUTION AND HABITAT. Erioneuron avenaceum var. avenaceum is common in rocky areas from the southwestern United States to central Mexico; it also grows in Bolivia and Argentina.

FIGURE 119

Culms (15)30–65 cm tall, 0.8–2 mm thick, glabrous or hirsute; nodes glabrous or densely villous. Ligules 0.2–0.6 mm long; blades 5–10 cm long, 2–2.5 mm wide, flat in moist conditions, both surfaces pilose to villous, green. Panicles compact (rarely

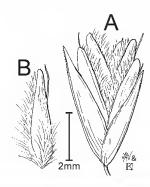

FIGURE 119. *Erioneuron nealleyi*. A. Spikelet. B. Floret. Drawn by Linda Ann Vorobik and Karen Klitz; copyright Utah State University.

open), 5–10 cm long, 1–3 cm wide, usually 2–4(6) times longer than wide, occasionally interrupted in the lower ½; branches with 5–17 shortly pedicellate spikelets. Spikelets 7–11 mm long, purplish to pale, with 3–15 florets; lower glumes 5–7 mm; upper glumes 6–9 mm long, generally equaling or exceeding the lowest florets; lemmas 4–6 mm long, awned from between the lobes, awns 1–3.5 mm long, apex bilobed, lobes 1.5–2.5 mm long, rounded to truncate, lateral veins forming a mucro to 1 mm long; anthers 1, 1–1.5 mm long. Caryopsis 1.3–1.5 mm long. 2n = 16.

DISTRIBUTION AND HABITAT. Erioneuron neal-leyi is found on rocky slopes in the southwestern United States and central Mexico. Stoloniferous plants are known only from central Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Aquiles Serdán: Camino a Santa Eulalia–San Guillermo, 30 Aug 1996, matorral xerófilo [xerophilous scrub], 1500 m, E. Estrada & C. Yen 5783 (CIIDIR). 161. *Erioneuron pilosum* (Buckley) Nash, Fl. S.E. U.S. 144: 1327, 1903. *Uralepis pilosa* Buckley, Proc. Acad. Nat. Sci. Philadelphia 14: 94. 1862.

FIGURE 120

Culms (6)10-30(40) cm tall, (0.3)0.6-1(2.5) mm thick, glabrous or hirsute. Ligules 2–3.5 mm long; blades (1)3-6(9) cm long, (0.5)1-1.5(2.5) mm wide, both surfaces sparsely pilose or glabrous, grayish-green. Panicles 1–4(6) cm long; branches with 3–9 shortly pedicellate spikelets. Spikelets 6-12(15) mm long, with (5)6-12(20) florets; glumes exceeded by the lowest florets, pale; lower glumes 4–7 mm long; upper glumes 4–7 mm long; lemmas 3–6 mm long, green or purplish-green when young, becoming stramineous at maturity, awned, awns 0.5-2.5 mm long, apex acute, entire or bidentate, teeth 0.3-0.5 mm long; stamens usually 3, anthers 0.3-1 mm long. Caryopsis 1-1.5 mm long. 2n = 16.

DISTRIBUTION AND HABITAT. Erioneuron pilosum grows on dry, rocky hills and mesas, often in oak and pinyon–juniper woodlands. In North America, it is represented by Erioneuron pilosum var. pilosum. This variety differs from the other two varieties, both of which are restricted to Argentina, in its longer, less equal glumes and shorter awns.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Samples not seen during the present revision but reported in Espejo Serna et al. (2000).

Festuca L. [Vulpia C. C. Gmel.]

Perennial and annual; bisexual; usually densely to loosely caespitose, with or without rhizomes, occasionally stoloniferous. Culms usually glabrous and smooth throughout, sometimes

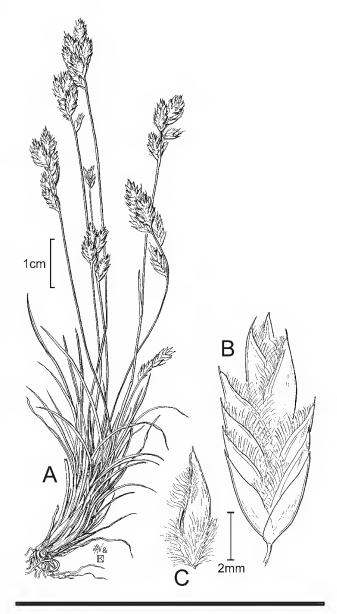

FIGURE 120. Erioneuron pilosum. A. Habit. B. Spikelet. C. Floret. Drawn by Linda Ann Vorobik and Karen Klitz; copyright Utah State University.

scabrous or densely pubescent below the inflorescences. Sheaths from open to the base to closed almost to the top, in some species sheaths of previous years persisting and the blades usually deciduous, in other species the senescent sheaths rapidly shredding into fibers and decaying between the veins and the blades not deciduous; collars inconspicuous or absent, usually glabrous; ligules membranous, truncate to acute, ciliate to erose; blades flat, conduplicate, involute, or convolute, sometimes glaucous or pruinose, glabrous

or scabrous, sometimes hirsute or puberulent. Inflorescences open or contracted panicles, sometimes reduced to racemes, usually with 1–2(3) branches at the lower nodes. Spikelets with (1)2–10 mostly bisexual florets, distal florets reduced or abortive; disarticulation above the glumes, beneath the florets. Glumes subequal or unequal, usually exceeded by the florets, ovate to lanceolate, acute to acuminate; lower glumes from shorter than to about equal to the adjacent lemmas, 1(3)-veined; upper glumes 3(5)-veined; lemmas usually chartaceous, sometimes coriaceous, bases more or less rounded dorsally, slightly or distinctly keeled distally, veins

5(7), prominent or obscure, apex acute to attenuate, sometimes minutely bidentate, usually terminally or subterminally awned or mucronate; paleas from shorter than to slightly longer than the lemmas, veins sparsely to densely scabrous-ciliate, bidentate; anthers 1 or 3. Caryopsis obovoid-oblong, adaxially grooved, usually free of the lemmas and paleas, sometimes adhering along the groove, sometimes adhering more broadly. x = 7.

Festuca is a widespread genus, with about 610 species (Soreng et al., 2017b). The species grow in alpine, temperate, and polar regions on all continents except Antarctica.

KEY TO SPECIES OF FESTUCA

1. Plants annual.
2. Lower glumes less than ½ the length of the upper glumes; spikelets 5–12 mm long, with 3–7 florets; rachilla internodes 0.75–1(1.9) mm; lemma awns 5–15(22) mm long
1. Plants perennial.
3. Leaf blades flat, occasionaly conduplicate, 5–15(18) mm wide; lemmas awned.
4. Lemma awn 0.5–4 mm long; ligules 2.5–7 mm long
4. Lemma awn 1–2 mm long; ligules 0.8–1.1(2) mm long
3. Leaf blades 1-2.5(3) mm wide, permanently enrolled or involute, when flat no wider than 3 mm; lemmas unawned to
short-awned.
5. Lemma apex bidentate, sometimes only emarginate, lemma awn 0.5–3(3.7) mm long, emerging between the teeth or emerging a little lower than the apex when emerginate; ligules 1.5–3.2(4.6) mm long
5. Lemma apex entire, unawned or awned emerging in the apex; ligules 0.5 mm long.
6. Plants loosely caespitose, often with short rhizomes; culms decumbent, much branched near the base; sheaths margins closed up to halfway; lemmas awned, awns 2–3 mm long
6. Plants densely caespitose, lacking rhizomes; culms erect, unbranched near the base; sheath margins closed up to 1/3 of the way from the base; lemmas unawned or apically mucronate, the mucro less than 1 mm long.
7. Anthers in the lowest floret usually abortive, anthers from the upper florets well-developed, 3–4.2 mm long F. diclina
7. Anthers in the lowest floret not abortive, all anthers approximately the same length, 1.6–6 mm long.
8. Leaf blades always folded (conduplicate or convolute), 0.5–1 mm wide, with 5–7(9) veins; panicle branches erect to spreading; apex of ovaries glabrous

8. Leaf blades flat to loosely folded, 2.5–3 mm wide, with 9–11 veins; panicles branches lax and loosely spreading, divaricate, basally naked and with the spikelets toward the apex; apex of ovaries pilose F. pringlei

162. Festuca amplissima Rupr. ex Fourn., Mex. Pl. 2: 125. 1881.

FIGURE 121

Perennial; strong. Culms 110–150 cm tall, erect, not branched, with the base hardened, nodes obscure. Leaves basal, numerous; sheaths fibrous, slightly scabrous, ligules 0.5–1.8 mm long, membranous, the basal very short; blades 20–50 cm long, 7–8 mm wide, stiff and erect, scabrous, apex attenuate to involute. Panicle solitary, terminal, exserted to 40 cm long, narrowly elliptic; branches up to 5 per node, 10–12 cm long, ascending, naked several centimeters near the base, rachis, branches, and angular pedicels scabrous on the margins. Spikelets 8.5–10 mm long, laterally compressed, plicate along the branches, pedicels generally short; lower glumes 3–4.5 mm long, linear, 1-veined, upper glume 4.8–6 mm long, 3-veined, lanceolate; florets 3–5,

often with a short terminal rudiment; lemmas 5.5–7 mm long, lanceolate, scabrous, 5-veined, keeled, unawned, acuminate, often purple over the back, bronzing near the apex; paleas almost as long as the lemmas, exserted abruptly to a point, scabrous between the keels; rachilla slender, scabrous; stamens 3, anthers 2.0–2.8 mm long, purple.

DISTRIBUTION AND HABITAT. *Festuca amplissima* is a rare species known only from clearings in forests with *Pinus* and *Quercus*. It is reported from Mexico, Central America, and South America (Stančík and Peterson 2007).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Canyons of the Sierra Madre, 16 Sep 1887, C.G. Pringle 1438 (MEXU) Isotype. Guachochi: Steep slopes above Barranca Basihuare, 28 Aug 2003, forest with oaks and pines, 1815 m, P.M. Peterson & P. Catalán 17573 (US).

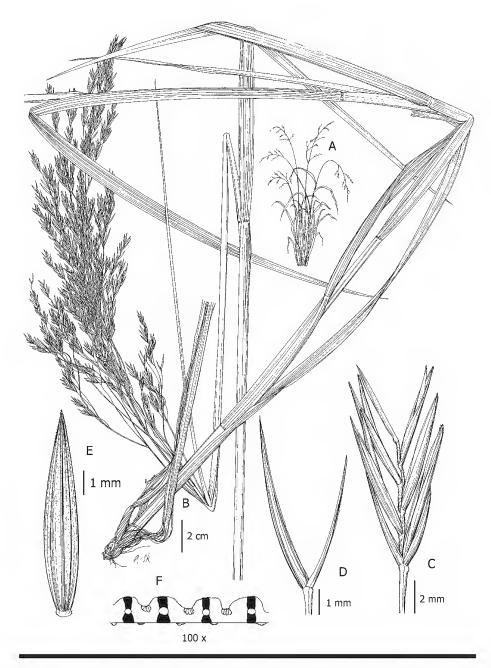

FIGURE 121. Festuca amplissima. A. Stylized growth form. B. Habit. C. Spikelet. D. Glumes. E. Lemma. F. Leaf blade cross-section. Drawn by Anna Skoumalová for Smithsonian Institution, Department of Botany.

163. *Festuca diclina* Darbysh., Novon 5(2): 129, f. 1A–F, 2A–C. 1995.

Perennial; delicate, densely caespitose, without rhizomes. Culms 30–90 cm long, erect, light green, with black or brown nodes, glabrous, not branched from base. Sheaths fibrous when

mature, margins closed less than ½ from the base; ligules 0.2–0.5 mm long, acute to truncate, sometimes lacerate, sparsely retrorse-scabrous; blades 1.2–1.5 mm wide (in the flat part), permanently inrolled or involute. Panicles 8–15 cm long, pyramidal, branches a little flexuous or sinuose-undulate, 1 or 2 per

node, glabrous to sparsely scabrous in the angles, the inferior 5–9 cm long. Spikelets 8–12 mm long, in the distal part of the branches with (2)3–4(5) florets; glumes ovate-lanceolate, the margin hyaline and wide, glabrous to scabrous over the keels (apically), lower glumes 2.4–4 mm long, 1-veined, upper glumes 3.5–5 mm long, (1)3-veined, rachilla with hairs of 0.1–0.3 mm; lemmas 6–8 mm long, narrowly lanceolate, glabrous or apically scabrous-hirsute, 1- to 3(5)-veined, apex entire, unawned or with a small mucro to 1 mm; paleas 5.5–7 mm long, 2-toothed, apically pilose-hirsute, hairs 0.1–0.2 mm long; anthers of the most inferior floret usually abortive, anthers of the upper florets 3–4.2 mm long, well-developed.

DISTRIBUTION AND HABITAT. Festuca diclina is endemic to Chihuahua and is found on steep, rocky, volcanic slopes with *Pinus*, *Quercus*, *Arctostaphylos*, and *Picea* at 2,620–3,300 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: 61.3 km W of Balleza and 33.8 km E of Guachochi, 2620 m, 18 Sep 1991, P.M. Peterson, C.R. Annable & J. Valdés Reyna 10774 (US). 163. Festuca lugens (E. Fourn.) Hitchc. ex Hern.-Xol., Bol. Soc. Bot. México 23: 165. 1958. Uniola lugens E. Fourn., Mexic. Pl. 2: 123. 1886.

Festuca mirabilis Piper.

Perennial; densely tufted with extravaginal innovations and rhizomes not elongated. Culms 100-200 cm tall, glabrous. Sheaths scabrous, straw color, not fibrous, margins free, auricles absent; ligule 2.5-7 mm long, ciliolate; blades 50-80 cm long, 3-6 mm wide, flat or folded, scabrous. Panicles 20-30 cm long, 5-10 cm wide, spread, lax; axis basally glabrous, apically scabrous, inferior branches 8-18 cm long, generally paired, widely spreading, naked in the inferior $\frac{1}{2}$; pedicels scabrous. Spikelets 15-20 mm long, with 5-7 florets; lower glumes 5.5-8 mm long, subulate, 1-veined, upper glumes 8-10 mm long; lemmas 12-15 mm long, scabrous, 2-toothed, with awns 1-4 mm long, scabrous; anthers 3.8-5.5 mm long; ovary glabrous. 2n=28.

DISTRIBUTION AND HABITAT. Festuca lugens grows in open areas of Pinus—Quercus forests. It is a Mexican species known from Chiapas, Chihuahua, Guanajuato, Hidalgo, Jalisco, México, Morelos, Nayarit, Oaxaca, Puebla, Querétaro, San Luis Potosí, Tamaulipas, Tlaxcala, and Veracruz.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Carichi: Sánchez, 12 Oct 1910, *Hitchcock* 7683 (US).

164. *Festuca myuros** L., Sp. Pl. 1: 74–75. 1753. *Vulpia myuros* (L.) C. C. Gmel., Fl. Bad. 1: 8. 1805.

Annual. Culms 10–75(90) cm tall, solitary or loosely tufted, branched or unbranched distally. Sheaths usually glabrous; ligules 0.3-0.5 mm long; blades 2.4-10.5(17) cm long, 0.4-3 mm wide, usually rolled, occasionally flat, usually glabrous. Inflorescences 3-25 cm long, 0.5-1.5(2) cm wide, dense panicles or spikelike racemes, with 1 branch per node, often partially enclosed in the uppermost sheaths at maturity, pulvini absent; branches spreading or appressed to erect. Spikelets 5-12 mm long with 3-7 florets; rachilla internodes 0.75-1(1.9) mm long; glumes glabrous; lower glumes 0.5-2 mm long, 1/5-1/2 the length of the upper glumes; upper glumes 2.5-5.5 mm long; lemmas 4.5-7 mm long, 5-veined, usually scabrous distally, glabrous except the margins sometimes ciliate, apex entire, awned, the awns 5-15(22) mm long; paleas 4.7-6.4 mm long, minutely bifid; anthers 0.5-1(2) mm long. Caryopsis 3-5 mm long, fusiform, glabrous. 2n = 14, 42.

DISTRIBUTION AND HABITAT. Festuca myuros grows in well-drained, sandy soils and disturbed sites. It is native to Europe and North Africa and once thought to be native to North America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Práxedis G. Guerrero: Sierra San Ignacio, 7.5 km al W de Col. Esperanza, 18 Mar 1995, en lecho [bed] de arroyo, 1190 m, R. Corral, P. Olivas & E. Pérez RCD6042 (UACJ).

165. Festuca octoflora Walter, Fl. Carol. 81. 1788. Vulpia octoflora (Walter) Rydb., Bull. Torrey Bot. Club 36: 538. 1909.

FIGURE 122

Annual. Culms 5–60 cm tall, solitary or loosely tufted, glabrous or pubescent. Sheaths glabrous or pubescent; ligules 0.3–1 mm long; blades to 10 cm long, 0.5–1 mm wide, flat or rolled, glabrous or pubescent. Panicles 1–7(20) cm long, 0.5–1.5 cm wide, with 1–2 branches per node; branches appressed to spreading. Spikelets 4–10(13) mm long, with (4)5–11(17) florets; rachilla internodes 0.5–0.7 mm long; lower glumes 1.7–4.5 mm long, $\frac{1}{2}$ - $\frac{2}{3}$ the length of the upper glumes; upper glumes 2.5–7.2 mm long; lemmas 2.7–6.5 mm long, 5-veined, smooth, scabrous, or pubescent, apex entire, no more pubescent than the bases, awns of the lowermost lemma in each spikelet 0.3–9 mm long; paleas slightly shorter than the lemmas, apex entire or minutely bifid, teeth shorter than 0.2 mm long; anthers 0.3–1.5 mm long. Caryopsis 1.7–3.7 mm long. 2n = 14.

DISTRIBUTION AND HABITAT. Festuca octoflora is a widespread native species growing in grasslands, sagebrush, and open woodlands, as well as in disturbed habitats and areas of secondary succession, such as old fields, roadsides, and ditches. It is known from United States to Mexico in Baja California, Baja California Sur, and Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Cerca del Río Chih., 7 Abr [Apr] 1886, C.G. Pringle s/n (MEXU). Janos: Ca. 8.2 km (by road), Sierra de Cal (La

Biznaga), 25 Mar 2007, Chihuahuan desert scrub, A.L. Reina & T.R. Van Devender 2007-307 (ARIZ).

166. Festuca pringlei St.-Yves, Candollea 2: 305. 1925.

Perennial; caespitose, not rhizomatous. Culms to 1.5 m tall, glabrous, erect, unbranched from the base. Leaves of 2 forms, the basal convolute, filiform, the cauline flat and involute toward the apex; basal sheaths fibrous, disintegrated at maturity, sheaths margin closed less than 1/3 from the base, lacking auricles; ligules 0.5 mm long, membranous and pilose; blades 20-30 cm long, 2.5-3 mm wide, flat to loosely folded with 9-11 veins. Panicles 15-22 cm long, lax and loosely spreading, divaricate, basally naked and with the spikelets toward the apex. Spikelets 10-15 mm long, with 4-5 flattened florets, widely spaced; glumes glabrous and apiculate; lower glumes 4-4.5 mm long; upper glumes 5-6.5 mm long, wider; lemma 6.5-8 mm long, smooth on the back, apex entire, unawned or with an apical mucro, less than 1 mm; palea equal or less than lemma; anthers 1.6-6 mm long from the inferior florets, not abortive, all about equal; ovaries pilose toward the apex.

DISTRIBUTION AND HABITAT. Festuca pringlei is an uncommon species that grows in pinyon forests; it is a Mexican species known from Aguascalientes, Chihuahua, Durango, and Jalisco.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guadalupe y Calvo: Mt. Mohinora, SW Chihuahua, 2820 m, 1 Sep 1898, E.W. Nelson 4900 (US); near Cumbre Mohinora, 13 Sep 2006, 3300 m, P.M. Peterson, F. Sánchez Alvarado & E.P. Gómez Ruíz 20046 (CIIDIR, US).

167. Festuca rosei Piper, Contr. U.S. Natl. Herb. 10: 45. 1906.

Perennial; caespitose, not rhizomatous. Culms 70–150 cm tall, glabrous, the culms several or many together. Sheaths persistent with shredded bases below; ligules 0.3–0.6 mm long, ciliolate; blades (10)20–40 cm long, 0.5–1 mm wide, filiform, tightly involute, terete or angled, margins scabrous with 5–7(9) prominent veins on the upper surface. Panicles 15–30 cm long, 2–5 cm wide with erect to spreading branches 3–5(10) cm long inserted solitary at a node. Spikelets (7)9–12 mm long, 3- to 6-flowered; glumes 3–7 mm long; lower glumes 3–4.5(5.5) mm long, 1-veined, subulate; upper glumes 4–7 mm long, 3-veined, wider than lower; lemmas (5.7)6–7 mm long, subulate, glabrous, margins involute, apex scabrous sometimes mucronate; paleas a little shorter or longer than the lemma, apex bifid; anthers (2.7)3–4 mm long, yellow; apex of ovaries glabrous.

DISTRIBUTION AND HABITAT. Festuca rosei occurs on steep, rocky, volcanic slopes with Pinus, Quercus, and Arctostaphylos at 2,500–3,100 m. This is the first report of F. rosei from Chihuahua, a species known from throughout western Mexico to Guatemala.

Specimens Examined. MEXICO. Chihuahua. Guachochi: 61.3 km W of Balleza and 33.8 km E of Guachochi, 2620 m, *P.M. Peterson, Annable & Valdés-Reyna 10775* (US).

168. Festuca rubra L., Sp. Pl. 1: 74. 1753.

FIGURE 123

Perennial; usually rhizomatous and loosely to densely caespitose, culms sometimes single and widely spaced, sometimes stoloniferous. Culms (8)10-120 (130) cm tall, erect or decumbent, glabrous and smooth. Sheaths closed for about 34 their length when young, readily splitting with age, usually pubescent, at least distally, hairs retrorse or antrorse, sometimes glabrous, not persistent, older vegetative shoot sheaths shredding into fibers; collars glabrous; ligules 0.1-0.5 mm long; blades usually conduplicate or convolute and 0.3-2.5 mm in diameter, sometimes flat and 1.5-7 mm wide, abaxial surfaces glabrous, smooth or scabrous, adaxial surfaces scabrous or pubescent, veins 5–9(13), ribs (3)5-7(9), usually conspicuous. Panicles (2)3.5-25(30) cm long, usually open or loosely contracted panicles, occasionally racemes, with 1-3 branches per node, lower branches with 2 or more spikelets; branches erect or spreading, stiff or lax, glabrous, scabrous, or pubescent. Spikelets (6)7–17 mm long, with 3–10 florets; glumes ovate-lanceolate to lanceolate, exceeded by the distal florets; lower glumes (1.5)2-6(7) mm long; upper glumes (3)3.5-8.5 mm long; lemmas 4-9.5 mm long, usually glabrous

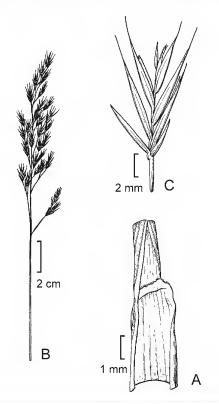

FIGURE 123. *Festuca rubra*. A. Ligule. B. Inflorescence. C. Spikelet. Drawn by Cindy Roché; copyright Utah State University.

and smooth, sometimes scabrous toward the apex, sometimes densely pubescent throughout, attenuate or acuminate in side view, awned, awns (0.1)0.4-4.5 mm long; paleas slightly shorter than to about equaling the lemmas, intercostal region puberulent distally; anthers 1.8–4.5 mm long; ovary apex glabrous. 2n = 28, 42, 56, 70.

DISTRIBUTION AND HABITAT. Festuca rubra is interpreted here as a morphologically diverse polyploid complex that is widely distributed in the arctic and temperate zones of Europe, Asia, and North America to Mexico, where it is known from Chihuahua, Coahuila, Distrito Federal, Durango, México, Nuevo León, Puebla, Querétaro, Tamaulipas, and Veracruz.

169. Festuca tolucensis Kunth, Nov. Gen. Sp. (quarto ed.) 1: 153. 1815.

FIGURE 124

Perennial; caespitose, forming dense tufts. Culms 60-100 cm tall, erect, not branched, nodes obscure, contracted, internodes glabrous, leaves mainly basal; sheaths glabrous, rugosegranular; ligule 1.5-3.2(4.6) mm long, slender, membranous, blades 18–25 cm long, 1–2.5 mm wide, scabrous, permanently inrolled or involute, if flat no more than 3 mm wide, scaberulous, superior portion of culms almost leafless. Inflorescence solitary, terminal, exserted to 30 cm long, panicles 11-20 cm long, spread but narrow, sparsely floreted, branches in pairs or solitary. Spikeletrs 9-14 cm long, usually purple, florets 6-8; lower glumes 4.5-6.3 mm long, narrowly triangular, 1-veined, upper glumes 6-7.4 mm long, ovate, acute, 3-veined; lemma 6-8 mm long, narrowly ovate, lemma apex 2-toothed, sometimes only emarginate, lemma awn 0.5–3(3.7) mm long, arising between the tooth or a lttle below the apex when emarginate, scaberulous; palea slightly shorter, 2-toothed in the apex; stamens 3, anthers 2.8–3.4 mm long, yellow.

DISTRIBUTION AND HABITAT. Festuca tolucensis is known from Mexico, Central America, and South America

Glyceria R. Br.

Plants usually perennial, rarely annual; rhizomatous. Culms erect or decumbent, freely rooting at the lower nodes, not cormous based. Sheaths closed for at least ¾ their length, often almost entirely closed; ligules scarious, erose to lacerate; blades flat or folded. Inflorescences terminal, usually panicles, sometimes racemes in depauperate specimens, branches appressed to divergent or reflexed. Spikelets cylindrical and terete or oval and laterally compressed, with 2–16 florets, terminal floret in each spikelet sterile, reduced; disarticulation above the glumes, below the florets. Glumes less than to equaling the adjacent lemmas,

1-veined, obtuse or acute, often erose; **lower glumes** 0.3–4.5 mm long; **upper glumes** 0.6–7 mm long; **calluses** glabrous; **lemmas** membranous to thinly coriaceous, rounded over the back, smooth or scabrous, glabrous or hairy, hairs to about 0.1 mm long, 5- to 11-veined, veins usually evident, often prominent and ridged, not or sparsely converging distally, apical margins hyaline, sometimes with a purplish band below the hyaline portion, apex acute to rounded or truncate, entire, erose, or irregularly lobed, unawned; **paleas** from shorter than to longer than the lemmas, keeled, keels sometimes winged; **lodicules** thick, sometimes connate, not winged; **anthers** (1)2–3; **ovaries** glabrous; **styles** 2-branched, branches divergent to recurved, plumose distally. x = 10.

Glyceria includes approximately 48 species, all of which grow in wet areas. All but five species are native to the Northern Hemisphere.

KEY TO SPECIES OF GLYCERIA

170. Glyceria borealis (Nash) Batch., Proc. Manchester Inst. Arts Sci. 1: 74. 1900.

FIGURE 125

Perennial. Culms 60-100 cm tall, 1.5-5 mm thick, often decumbent and rooting at the lower nodes. Sheaths glabrous, keeled; ligules 4-12 mm long; blades 9-25 cm long, 2-7 mm wide, often floating, abaxial surfaces smooth, adaxial surfaces of the midcauline leaves densely papillose, glabrous. Panicles 18-40(50) cm long, 0.5-2(5) cm wide, arching, usually narrow, open at anthesis, bases often enclosed in the upper leaf sheath at maturity; branches 5–10(15) cm long, usually 1–3(5) per node, usually appressed to strongly ascending, occasionally spreading, longer branches with 3-6 spikelets; pedicels 1.2-5 mm long. Spikelets 9-22 mm long, 0.8-2.5 mm wide, cylindrical and terete, except at anthesis when slightly laterally compressed, rectangular in side view, with 8-12 florets; glumes elliptic, apex rounded to obtuse, sometimes erose; lower glumes 1.2-2.2 mm long; upper glumes 2–3.8 mm long, rounded; rachilla internodes 0.6–3.5 mm long; lemmas 2.7–5.4 mm long, veins raised, scaberulous or smooth, intercostal regions usually smooth, sometimes scaberulous, midvein terminating about (0.1)0.2 mm short of the apical margin, apex usually acute, sometimes obtuse, usually entire; paleas usually shorter than or equaling the lemmas, sometimes exceeding them by up to 0.5 mm long, keels narrowly winged, apex bifid, teeth to 0.2 mm long, parallel to weakly incurved; stamens 3, anthers 0.4–1.5 mm long. Caryopsis 1.2–2 mm long. 2n = 20.

DISTRIBUTION AND HABITAT. Glyceria borealis is a widespread native species that grows in the North America

through the western mountains of the United States to Chihuahua, Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Madera: Lake near Chuichupa, 22 Aug 1937, *LeSueur 0203* (US).

171. Glyceria striata (Lam.) Hitchc., Proc. Biol. Soc., Washington 41: 157. 1928.

FIGURE 126

Perennial. Culms 20-80 (100) cm tall, (1.5)2-3.5 mm thick, not or only slightly spongy, sometimes rooting at the lower nodes. Sheaths smooth to scaberulous, keeled, sometimes weakly so; ligules 1-4 mm long, usually rounded, sometimes acute to mucronate, erose-lacerate; blades 12-30 cm long, 2-6 mm wide, smooth or scaberulous. Panicles 6-25 cm long, 2.5-21 cm wide, pyramidal, open, nodding; branches 5-13 cm long, straight to lax, with 15-50 spikelets, these often confined to the distal ²/₃; pedicels 0.5-7 mm long. Spikelets 1.8-4 mm long, 1.2-2.9 mm wide, laterally compressed, oval in side view, with 3-7 florets; glumes ovate, 1-1.5 times longer than wide, narrowing from midlength or above, veins terminating below the apical margins, apex often splitting with age; lower glumes 0.5-1.2 mm long, rounded to obtuse; upper glumes 0.6-1.2 mm long, acute or rounded; rachilla internodes 0.1-0.6 mm long; lemmas 1.2-2 mm long, ovate in dorsal view, veins raised, scaberulous over and between the veins, apex acute, prow-shaped; paleas slightly shorter than to equaling the lemma in length, 1.5-3 times wider than the glumes, keeled, keels not winged, tips pointing toward each other, apex narrowly notched between

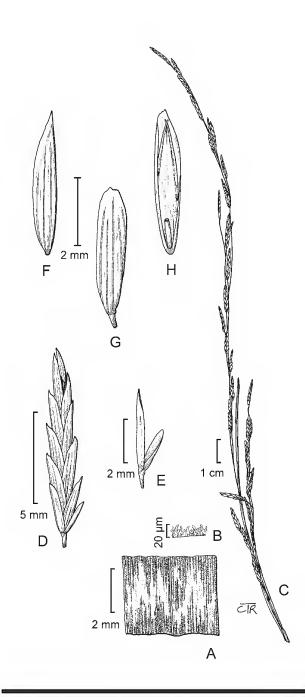

FIGURE 125. Glyceria borealis. A. Upper leaf surface. B. Papillose hairs, magnified. C. Inflorescence. D. Spikelet. E. Glumes. F. Floret, side view. G. Floret, dorsal view. H. Floret, ventral view showing palea and rachilla. Drawn by Cindy Roché; copyright Utah State University.

the keels; stamens 2, anthers (0.2)0.4-0.6 mm long, purple or yellow. Caryopsis 0.5-2 mm long. 2n = 20 (reports of 28 are questionable).

DISTRIBUTION AND HABITAT. Glyceria striata grows in bogs, along lakes and streams, and in other wet places. It range extends from Canada and the United States to Mexico. There are two varieties; Glyceria striata var. striata is found in Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Madera: Sierra Madre near Col. Garcia, 6 Jul 1899, C.H.T. Townsend & C.M. Barber 112 (NMC, US).

Hackelochloa Kuntze

Perennial; caespitose. Culms solid, very branched. Sheaths carinate; ligules a ciliate membrane; blades widely linear, flat. Inflorescence a solitary raceme, racemes terminal and axillary, exserted, aggregated into a spathate false panicle; rachis articulate, flattened, glabrous, spikelets in pairs, the 2 spikelets and the internodes of rachis falling as a unit. Spikelets dimorphic, unawned, sessile and pedicelate. Sessile spikelets globose, rigid, with 2 florets; callus truncate, with a short cylindrical projection; lower glumes very inflated, the superior portion rounded, blackish, 13- to 15-veined, the surface covered with squares sculpted in transverse rows or punctuate on rows between the veins; upper glumes appressed to the internodes of rachis, oblong, 3-veined, obtuse, slightly carinate, chartaceous; inferior florets sterile; inferior lemma hyaline, inferior palea missing; superior florets bisexual, staminate, or sterile, superior lemma and palea hyaline, veinless, entire; stamens 3. Pedicelate spikelets herbaceous, sterile, rarely staminate; pedicel adnate to the rachis internodes; lower glumes ovate, acute, green, 7- to 9-veined, enclosing the margins of upper glumes by 2 borders; rudimentary florets missing or when present the inferior rudiment sterile, the superior floret staminate.

Hackelochloa includes two species from the tropics of Asia and a single species naturalized in Mexico (Clayton et al., 2006).

172. Hackelochloa granularis* (L.) Kuntze, Revis. Gen. Pl. 2: 776. 189. Cenchrus granularis L., Mant. Pl. 2: 575. 1771. Mnesithea granularis (L.) de Koning & Sosef., Blumea 31(2): 295. 1986.

FIGURE 127

Perennial. Culms 10–120 cm tall. Sheaths inflated, hispid with tubercle-based hairs; ligules 0.8–1.5 mm long; blades 2–20 cm long, 4–15 mm wide, hispid with tubercle-based hairs. Racemes 7–15 mm long. Sessile spikelets 1–1.7 mm long; lower glumes 1.3–1.7 mm long, with the surface covered with squares sculpted in transverse rows; upper glumes 0.8–1 mm long; superior lemma and palea 0.8–1 mm long; anthers 0.2–0.4 mm long; pedicelate spikelets 1–1.9 mm long; anthers 0.3–0.5 mm long. 2*n* = 14.

DISTRIBUTION AND HABITAT. Hackelochla granularis occurs in grasslands, thorn scrub, and tropical forests at

Hesperostipa (M. K. Elias) Barkworth

Perennial; caespitose, not rhizomatous. Culms erect, not branching at the upper nodes; prophylls shorter than the sheaths. Leaves not overwintering, not basally concentrated; cleistogenes not developed; sheaths smooth, auricles absent; ligules membranous, frequently ciliate; blades usually tightly involute, adaxial surfaces conspicuously ridged, apex narrowly acute, not sharp. Inflorescences terminal panicles, contracted or open. Spikelets with 1 floret; rachillas not prolonged beyond the base of the floret, disarticulation above the glumes and beneath the floret. Glumes tapering from near the base to a hairlike tip; florets narrowly cylindrical; calluses 2-6 mm long, sharp, densely strigose distally; lemmas indurate, smooth, margins flat, slightly overlapping at maturity, the upper portion fused into a papillose, ciliate crown, awned, lemma-awn junction distinct, awns persistent, twice-geniculate, often weakly so, lower segments twisted and scabrous to pilose, terminal segment not twisted, usually scaberulous or pilose; paleas equal to the lemmas, flat, pubescent, coriaceous, 2-veined, veins terminating at the apex, apex indurate, prow-tipped; anthers 3. Caryopsis fusiform, not ribbed. x = 11.

Hesperostipa is a North American endemic genus that resembles the Eurasian Stipa sensu stricto (s.s.) in overall morphology but is probably more closely related to the primarily South American genera Piptochaetium, Anatherostipa (Hack.

FIGURE 127. Hackelochloa granularis. A. Habit. B. Culm and Inflorescence. C. Inflorescence. D. Spikelet pair. E. Spikelet pair, rotated 180°. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

ex Kuntze) Peñail., *Aciachne* Benth., and *Lorenzochloa* Reeder & C. Reeder (Romaschenko et al., 2012). *Hesperostipa* differs from *Stipa* s.s. in having indurate palea apex and an unordered saw-like lemma epidermal pattern (Romaschenko et al., 2012).

FIGURE 128

Culms 40–100 cm tall; lower nodes glabrous. Lower sheaths glabrous or puberulent, not ciliate; ligules of lower leaves 0.5–1 mm long, thickly membranous, rounded; ligules of upper leaves to 3 mm long, scarious, acute; blades 0.5–1 mm wide. Panicles 10–30 cm long; glumes 30–60 mm long, subequal; florets 15–18 mm long; calluses 4–5 mm long; lemmas evenly pubescent, hairs shorter than 1 mm long; awns 12–22 cm long, first 2 segments hairy, hairs mostly 0.2–1 mm long, terminal segment flexible, pilose, the hairs 1–3 mm long, 2n = 44.

DISTRIBUTION AND HABITAT. Hesperostipa neomexicana grows in grassland, oak, and pinyon pine associations, usually in well-drained, rocky areas in the southwestern United States and adjacent Mexico; at 800 to 2,400 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Sierra San Martin de Borracho, Rancho Carrizozo on the north side, 15 Jun 1973, Izotal on midslopes, chaparral on top, 1500–2195 m, M.C. Johnston & F. Chiang 11341 (MEXU).

Heteropogon Pers.

Annual or perennial; caespitose. Culms simple or branched. Leaves sometimes aromatic and smelling of lemon oil or citronella; sheaths keeled, sometimes with a row of glandular depressions on the keel; ligules membranous, glabrous or ciliate. Inflorescences terminal and axillary; peduncles usually with 1 rame, sometimes with several in a digitate cluster; rames with 3–10 homogamous, unawned, sessile-pedicellate spikelet pairs on the lower ¼–¾ and heterogamous, awned, sessile-pedicellate spikelet pairs distally, axes slender, without a translucent median groove; disarticulation in the rames, beneath the sessile spikelets of the heterogamous spikelet pairs, sometimes also below their pedicellate spikelets. Homogamous spikelet units sterile or staminate; calluses poorly developed; glumes membranous, many-veined, keels winged above. Heterogamous spikelet units: sessile spikelets bisexual, terete;

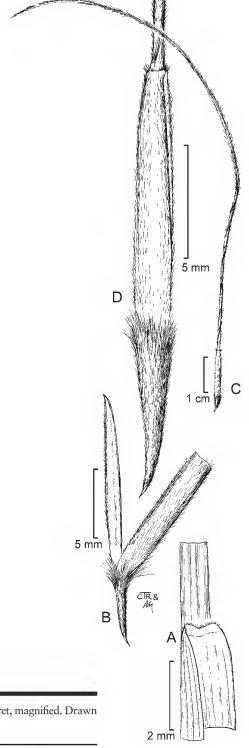

FIGURE 128. *Hesperostipa neomexicana*. A. Ligule. B. Glumes. C. Floret. D. Floret, magnified. Drawn by Cindy Roché and Annaliese Miller; copyright Utah State University.

calluses sharp, antrorsely strigose, hairs golden brown; glumes coriaceous, pubescent, concealing the florets; lower glumes enclosing the upper glumes, obscurely 5- to 9-veined; upper glumes sulcate, 3-veined; lower florets sterile, reduced to a hyaline lemma; upper florets bisexual, lemmas with conspicuous, geniculate awns; awns with hairs. Caryopsis lanceolate, sulcate on 1 side. Pedicels short, free of the rame axes, not grooved; pedicellate spikelets sterile or

staminate, larger than the sessile spikelets; calluses long, glabrous, functioning as pedicels; glumes membranous, many-veined, keels winged above. x = 10, 11.

Heteropogon is a pantropical genus of five species (Clayton et al., 2006). Probably both species that occur in the Western Hemisphere and here in Chihuahua are introduced (Barkworth, 2003a).

KEY TO SPECIES OF HETEROPOGON

174. Heteropogon contortus* (L.) P. Beauv. ex Roem. & Schult., Syst. Veg. 2: 836. 1817. Andropogon contortus L., Sp. Pl. 2: 1045. 1753.

FIGURE 129

Perennial. Culms 20–150 cm tall, erect. Sheaths smooth, reddish; ligules 0.5–0.8 mm long, cilia 0.2–0.5 mm long; blades 10–15 cm long, 2–7 mm wide, flat or folded, glabrous or pubescent. Rames 3–7 cm long, secund, with 12–22 sessile-pedicellate spikelet pairs, brown to reddish-brown. Homogamous spikelets 6–10 mm long. Heterogamous spikelets: sessile spikelets 5–10 mm long, brown, awned; calluses 1.8–2 mm long, strigose; awns 6–10 cm long; pedicellate spikelets 6–10 mm long, unawned; glumes ovate-lanceolate, glabrous or with papillose-based hairs distally, without glandular pits, greenish to purplish-brown, becoming stramineous when dry. 2n = 40, 50, 60.

DISTRIBUTION AND HABITAT. Heteropogon contortus grows on rocky hills and canyons in the southern United States, occupying a variety of different habitats, including disturbed sites. It is found in tropical and subtropical areas throughout the world.

Annual. Culms 50–200 tall, often with prop roots, freely branching above the base. Sheaths glabrous, with a row of glandular depressions along the keel; ligules 2–4 mm long, erose to lacerate, glabrous; blades 30–50 cm long, 3–12 mm wide, usually folded, abaxial surfaces with dark glandular depressions along the keel, adaxial surfaces with scattered papillose-based hairs near the base, scabrous elsewhere. Rames 2.5–6.5 cm long. Homogamous spikelets 10–14 mm long, green; lower glumes glabrous, unawned. Heterogamous spikelets: sessile spikelets 8–11.5 mm long, dark brown, awned; calluses about 3 mm long, the awns 10–15 cm long; pedicellate spikelets 16–21 mm long, unawned; lower glumes scabrous or sparsely ciliate distally, midveins glandular, pitted. 2n = 20.

DISTRIBUTION AND HABITAT. Heteropogon melanocarpus is found in tropical regions throughout the world.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Puente Río Batopilas hacia [toward] la Hierbabuena, 24 Mar 2003, 1942 m, *Tenorio, R. Alvarado & M. Hilerio* 22848 (US). Hilaria Kunth

Perennial or annual; tufted or caespitose, sometimes stoloniferous, perennial species sometimes rhizomatous. Culms erect or decumbent; nodes usually villous or pilose, particularly the upper nodes. Sheaths open, glabrous or pilose, lower sheaths often glabrous basally and pilose distally, margins sometimes villous or pilose, upper sheaths often glabrous even if the lower sheaths are pilose; ligules membranous, lacerate or ciliate. Inflorescences terminal, spikelike panicles of reduced, disarticulating branches, exceeding the upper leaves; branches with 3 spikelets, appressed to the rachises, bases straight, seated in a ciliate, cuplike structure, sometimes with a callus, calluses pilose, axes not extending past the distal florets; disarticulation at the base of the branches, leaving the zigzag rachises. Lateral spikelets of each branch shortly pedicellate, with 1-4(5) sterile or staminate florets; glumes almost as long as the florets, deeply cleft into 2 or more lobes, with 1 or more dorsal awns; lemmas membranous, hyaline. Central spikelets sessile, with 1 pistillate or bisexual floret; glumes shorter than the florets, rigid, indurate and fused basally, apex with 2 or more lobes; lemmas membranous, awned or unawned. x = 9.

Hilaria is a genus of 10 species that ranges from the south-western United States to northern Guatemala. Based on molecular DNA studies, *Hilaria* can be divided into two subgenera, *H.* subg. *Pleuraphis* (Torr.) Columbus, which includes *H. mutica* and *H. rigida*, and *H.* subg. *Hilaria*, which includes *H. belangeri*, *H. cenchroides*, and *H. ciliata* (Peterson et al., 2016).

KEY TO SPECIES OF HILARIA

- 1. Glumes hyaline and fimbriate at the apex; plants forming colonies from the growing rhizomes, the rhizomes indurate and scaly.
- 1. Glumes firm, not fimbriate at the apex; plants forming simple mats united by slender stolons, arched, not rhizomatous.

 - 3. Glumes of lateral spikelets much shorter than lemmas; glomerules 3.5–6.5 mm long.

 - 4. Spikelets generally gray or black; lateral spikelets 4.5–5.6 mm long, central spikelets 5–6 mm long; glumes with numerous and conspicuous black glands.

176. Hilaria belangeri (Steud.) Nash, N. Amer. Fl. 17(2): 135. 1912.

Perennial; caespitose, usually stoloniferous. Culms 5-35 cm tall, erect; nodes villous. Sheaths striate, glabrous; ligules 1–3 mm long, often lacerate; blades 3-15 cm long, 1-3.5 mm wide, adaxial surfaces sparsely pilose, hairs papillose-based, margins sparsely pilose basally, with similar hairs. Panicles 2-4 cm long; involucres 5-8 mm long. Lateral spikelets with 2(3) staminate florets, or 1 sterile floret; glumes unequal, thick, indurate, and conspicuously fused basally, thinner distally, asymmetrically lobed, scabrous, pale to purplish, bases sometimes spotted with a few dark glands, margins wide, hyaline, awns 1 or more, attached below midlength, equaling or exceeding the central spikelets, antrorsely scabrous; lower glumes wider, more deeply lobed, with longer awn(s) than the upper glumes; stamens 3, anthers 3-3.7 mm long. Central spikelets as long as or longer than the lateral spikelets, with 1 pistillate floret; glumes terminating in 1 or more antrorsely scabrous awns. 2n = 36, 72, 74.

DISTRIBUTION AND HABITAT. Hilaria belangeri ranges from the United States to Mexico in Aguascalientes, Baja California, Baja California Sur, Chihuahua, Coahuila, Guanajuato, Guerrero, México, Michoacán, Morelos, Nuevo León, Oaxaca, Puebla, Querétaro, Sonora, and Tamaulipas. It has two varieties, only the typical variety is found in Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

177. Hilaria cenchroides Kunth, Nov. Gen. Sp. (quarto ed.) 1: 117, t. 37. 1815.

Perennial; caespitose, stoloniferous. Culms 5-60 cm long, erect, nodes bearded. Sheaths longer than adjacent culm internode, striately veined, outer margin hairy; ligules 1.5-2 mm long, an eciliate membrane, lacerate; blades 3-10 cm long, 2-4 mm wide, flat or involute, stiff, surface ribbed, rough on both sides, glabrous or pilose, margins scabrous. Panicles composed of racemes; racemes 0.4-0.8 cm long, borne along a central axis; closely spaced; in a multilateral false spike, cuneate, unilateral, axis 2-6 cm; deciduous from axis, spikelets 1 fertile and 2 sterile, sessile. Sterile spikelets 3-5 mm long, 2-4-flowered; lemmas as long as the bisexual spikelets, empty or male, oblong, asymmetrical, dorsally compressed, exserted from the glumes, apex muticous; glumes 1.5-4 mm long, 5- to 11-veined, scabrous, united below, coriaceous, 2-lobed, truncate or obtuse, both glumes awned, the awn 1-2 mm long, lemmas 2-4, exserted from glumes. Bisexual spikelets 4-7.5 mm long, 1-flowered, oblong, laterally compressed, falling entire and with sterile spikelets; glumes 4-5 mm long, ovate, coriaceous, black, 1-keeled, 7-veined, scabrous, equal, connate along margins below, shorter and firmer than fertile lemmas, apex 2-lobed, truncate or obtuse, 1-awned, the awn about 3 mm long; lemmas 5-6 mm long, ovate, laterally compressed, cartilaginous, keeled, 3-veined, apex caudate; stamens 3, anthers 3–3.5 mm long. 2n = 44.

DISTRIBUTION AND HABITAT. Hilaria cenchroides is distributed in the grasslands of Mexico and Central America. This species grows on dry slopes, flats, and along gravelly drainages in desert scrub and pine—oak woodlands commonly associated with Acacia, Quercus intricata Trel., Pinus cembroides, Rhus virens Lindh. ex A. Gray, Bouteloua dactyloides, Juniperus deppeana Steud., Baccharis, Opuntia, Stevia, and Viguiera.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000).

178. Hilaria ciliata (Scribn.) Nash, N. Amer. Fl. 17(2): 136. 1912.

Perennial; caespitose, stolons present. Culms 20-45 cm tall, tufted, erect, bearded below inferior nodes. Sheaths striate, mostly shorter than internodes, glabrous, the inferior sparsely papillose-pilose over the collar; ligules 2-2.5 mm long, eciliate membrane, sparsely pilose; blades 1.5–15(20) cm long, 3–5 mm wide, scabrous, sometimes with some papillose hairs on margins. Panicles composed of racemes, the racemes 3-5 cm long, in a multilateral false spike, cuneate, rachis pilose; glomerules or false involucres 3.5-5(5.8) mm long with 1 fertile spikelet and 2 sessile and sterile spikelets. Sterile spikelets 3-4 mm long, as long as bisexual spikelets, well-developed, male, oblong, asymmetrical, laterally compressed; glumes united below, coriaceous, 5-veined, scabrous, ciliolate on margins, muticous; lemmas 3, exserted from glumes, apex muticous. Bisexual spikelets 4-7.5 mm long, 1-flowered, oblong, laterally compressed, falling entire and with sterile florets; glumes shorter than the spikelet, asymmetrical, coriaceous, pallid, 1-keeled, scabrous, connate along the margins below, the margins ciliolate, apex 2-lobed, awned, the awn 1 mm long; lower glumes 1.2-2 mm long, 3-veined, awned; upper glumes 2.8-3.8 mm long, 5-veined; fertile lemma 3-4 mm long, ovate, laterally compressed, cartilaginous, keeled, 3-veined, apex caudate; stamens 3, anthers 3–3.5 mm long. 2n = 36.

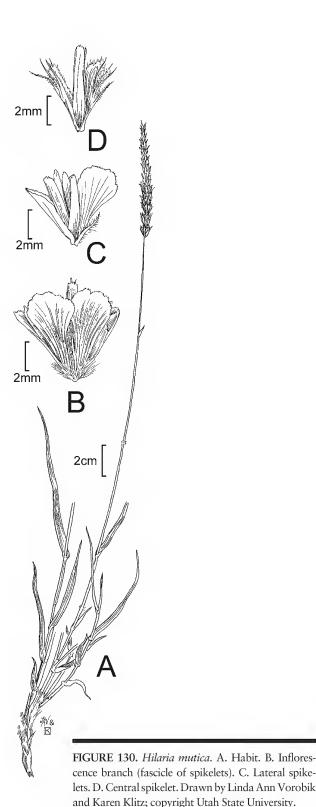

DISTRIBUTION AND HABITAT. Hilaria ciliata is a Mexican species cited from Baja California, Baja California Sur, Chihuahua, Colima, Guanajuato, Guerrero, Jalisco, Michoacán, Nayarit, Oaxaca, Quéretaro, San Luis Potosí, Sonora, and Veracruz.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

179. *Hilaria mutica* (Buckley) Benth., J. Linn. Soc., Bot. 19: 62. 1881. *Pleuraphis mutica* Buckley, Proc. Acad. Nat. Sci. Philadelphia 14: 95. 1862.

FIGURE 130

Perennial; caespitose, rhizomatous. Culms 30–60 cm tall, erect, geniculate at the middle nodes; nodes glabrous or pubescent, hairs to 0.3 mm. Sheaths glabrous or sparsely pilose on the margins; ligules 0.5–2 mm long, lacerate; blades 2–15 cm

long, 2–4 mm wide, mostly scabrous on both surfaces, with papillose-based hairs behind the ligules. Panicles 4–8 cm long; involucres 5–8 mm long. Lateral spikelets with 1 or 2(4) staminate florets; glumes not conspicuously fused basally, thin, hyaline, papery, flabellate, dorsally awned, awns not exceeding the apex, apical lobes rounded, ciliate to finely laciniate, veins not or sparsely excurrent; anthers 3, 2.5–3.5 mm long. Central spikelets with 1 bisexual floret; glumes with 1 or more divergent, dorsal awns, apical lobes, ciliate to finely laciniate, veins excurrent; lemmas exceeding the glumes, bilobed, mucronate. 2n = 36, 54.

DISTRIBUTION AND HABITAT. Hilaria mutica grows in alkaline flats, level upland areas, and desert valleys subject to occasional flooding but lacking permanent streams. Its range extends from southwestern United States to northern Mexico in Baja California Sur, Chihuahua, Coahuila, Durango, Nuevo León, Sonora, and Zacatecas.

180. *Hilaria rigida* (Thurb.) Benth. ex Scribn., Bull. Torrey Bot. Club 9(3): 33. 1882. *Pleuraphis rigida* Thurb., Bot. California 2: 293–294. 1880.

FIGURE 131

Perennial; with hard rhizomatous base. Culms 1.5–2.5 m tall, in large groups, rigid, branched, tomentose pubescent. Sheaths overlapping, scabrous; ligule 1 mm long, a row of fine hairs; blades 2–5 cm long, 2–4 mm wide, slightly involute, escabrous. Panicles 3–9 cm long, involucres 6–12 mm long, densely barbed on the base; lateral spikelets staminate with 2–4 florets, superior floret sterile; glumes thin, fimbriate, hyaline, 7-veined, almost always 2- to 4-lobed on the apex, apex wide, 1–3 veins that terminate in slender awns, or the veins are inconspicuous and sparsely excurrent (variable in the same inflorescence). Central spikelets bisexual, 1-flowered, equal or longer than the lateral spikelets; glumes narrow, fimbriate, hyaline with several awns and 2 or more lobes deeply notched; lemma frequently longer than the glumes, slender, ciliate, 2- to 4-lobed, the midvein excurrent into a short awn. 2n = 54.

DISTRIBUTION AND HABITAT. Hilaria rigida grows in pine forests; it ranges from the United States to Mexico in Baja California, Chihuahua, Oaxaca, and Sonora.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Casas Grandes: Col. Díaz, 30 Mar 1894, *E.A. Mearns* 2848/406 (US).

181. Hilaria swallenii Cory, Wrightia 1: 215. 1948.

Perennial; stoloniferous. Culms 10–35 cm long, erect; nodes villous. Sheaths slightly scabrous; ligules 2–2.2 mm long; blades to 8 cm long, 1–2 mm wide, mostly basal, both surfaces scabrous, sometimes also sparsely pilose. Panicles 1–4 cm long, with 2–8 involucres; involucres 6.5–8 mm long. Lateral spikelets 2-flowered, lowest florets usually sterile, distal florets staminate; glumes unequal, thick, indurate, and conspicuously fused basally, mostly gray to dark brown, evenly and sparsely to densely spotted with dark glands, awned from above midlength, margins hyaline; stamens 3, anthers 3–3.5 mm long. Central spikelets with 1 pistillate floret; lemmas elliptic basally, narrower and parallel-sided distally. 2n = 54, 72.

DISTRIBUTION AND HABITAT. Hilaria swallenii grows on dry plains and rocky mesas in New Mexico, Texas, and northern Mexico in Chihuahua, Coahuila, Durango, Nuevo León, San Luis Potosí, and Zacatecas.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: Sánchez, 12 Oct 1910, *Hitchcock* 7694 (US). Chihuahua: near Chihuahua, 23 Aug 1885, C.G. *Pringle* 493 (US); La Campana, Potrero del Plan, 3 km Ote. [W] carr. [hwy] Panamericana,

Holcus L.

Plants usually perennial, rarely annual; caespitose or rhizomatous, rarely both caespitose and rhizomatous. Culms glabrous or pubescent; nodes glabrous or retrorsely pubescent. Sheaths open; auricles absent; ligules membranous, entire or erose-ciliate, glabrous or puberulent; blades flat, pubescent. Inflorescences terminal panicles, contracted to open. Spikelets laterally compressed, with 2(3) florets, lower florets bisexual, upper floret(s) staminate or sterile; rachillas curved below the lowest florets, sometimes prolonged beyond the uppermost florets; disarticulation below the glumes. Glumes equaling to exceeding the florets, strongly keeled; lower glumes 1-veined; upper glumes 3-veined; calluses glabrous or pubescent; lemmas firm, shining, glabrous or pubescent, obscurely 3- to 5-veined, often bidentate; lower lemmas unawned; upper lemmas awned from below the apex, awns hooked or geniculate; paleas thin, subequal to the lemmas; lodicules 2, glabrous, toothed or not toothed; anthers 3; ovaries glabrous. Caryopsis glabrous. x = 4, 7.

Holcus, a genus of eight species, is native to Europe, North Africa, and the Middle East.

182. Holcus lanatus* L., Sp. Pl. 2: 1048. 1753.

FIGURE 132

Perennial; caespitose, not rhizomatous. Culms 20-100 cm tall, erect, sometimes decumbent, lower internodes densely pilose, with hairs to 1 mm long, uppermost internode often glabrous. Sheaths densely pubescent; ligules 1-4 mm long, truncate, erose-ciliolate; blades 2–20 cm long, (3)5–10 mm wide, densely soft-pubescent. Panicles 3-15(20) cm long, 1-8 cm wide; branches hirsute; pedicels 0.2-1.6(4) mm long, pilose, hairs to 0.3 mm. Spikelets 3-6 mm; rachillas 0.4-0.5 mm long, glabrous; glumes exceeding and enclosing the florets, membranous, ciliate on the keels and veins, usually scabrous, puberulent, or villous between the veins, especially toward the apex, whitishgreen, often purple over the veins and toward the apex; lower glumes lanceolate, narrow, acute; upper glumes ovate, wider and longer than the lower glumes, midveins often prolonged as an awn to 1.5 mm long, apex obtuse, somewhat bifid; calluses sparsely hirsute; lemmas 1.7-2.5 mm long, acute, eroseciliate; upper lemmas shallowly bifid, awns 1-2 mm long, often

FIGURE 132. Holcus lanatus. A. Habit. B. Ligule. C. Glumes. D. Florets. E. Caryopsis. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

purple-tipped, slightly twisted and strongly hooked at maturity; anthers (1.2)2-2.5 mm long. 2n = 14.

DISTRIBUTION AND HABITAT. Holcus lanatus grows in disturbed sites, moist waste places, lawns, and pastures in a wide range of edaphic conditions; 0–2,300 m. A native of Europe, *Holcus lanatus* was widely distributed in North America by 1800.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

Hopia Zuloaga & Morrone

Perennial; short rhizomatous and long stoloniferous. Culms not cormous at the base, not branched above the base; nodes swollen, villous, particularly on the stolons. Ligules membranous, papery; blades linear-lanceolate, cross sections with Kranz anatomy with a single mestome sheath surrounding the vascular bundles and in contact with the metaxylem vessels. Panicles contracted; branches spikelike, appressed, 1-sided, spikelets borne in pairs. Spikelets ellipsoid to obovoid. Lower glumes $\frac{34}{2}$ as long as the spikelets, 5- to 7-veined; upper glumes subequal to the lower lemmas, 7- to 11-veined, blunt; lower florets staminate; lower paleas well-developed; upper florets obovoid, indurate, smooth, with microhairs and simple papillae near the base and tip. x = 10.

Hopia is a unispecific genus that extends from the southwestern United States into northern Mexico.

183. *Hopia obtusa* (Kunth) Zuloaga & Morrone, Taxon 56: 151. 2007. *Panicum obtusum* Kunth, Nov. Gen. Sp. (quarto ed.) 1: 98–99. 1815.

FIGURE 133

Perennial; usually from long slender stolons or shallow rhizomes with swollen, villous nodes. Culms 20-80 cm tall, often in small clumps, compressed, erect or decumbent, glaucous; lower nodes pubescent; upper nodes glabrous. Lower sheaths ascending, pubescent to pilose; upper sheaths glabrous; ligules 0.2-2 mm long, membranous, truncate, irregularly denticulate; blades 3-26 cm long, 2-7 mm wide, ascending, firm, glaucous, sparsely pilose near the base, often scabrous on the margins, involute toward the apex. Panicles 5-15 cm long, 0.8-1.5 cm wide; branches 2-6, spikelike, erect, puberulent, 3-angled; ultimate branchlets 1-sided; pedicels paired, congested, shorter pedicels 0.1-1 mm long, longer pedicels 1.5-2.5 mm long. Spikelets 2.8-4.4 mm long, ellipsoid, terete to slightly laterally compressed, glabrous, obtuse; lower glumes about 34 as long as the spikelets, 5- to 7-veined; upper glumes and lower lemmas equaling the spikelets, 5- to 9-veined; lower florets staminate; lower paleas 2.5–3.5 mm long; upper florets puberulent at the bases and apex. 2n = 20, 36, 40.

DISTRIBUTION AND HABITAT. *Hopia obtusa* grows in seasonally wet sand or gravel, especially on stream banks, ditches, roadsides, wet pastures, and rangeland.

Hordeum L.

Plants summer or winter annuals or perennials; caespitose, sometimes short rhizomatous. Culms to 135(150) cm long, erect, geniculate, or decumbent; nodes glabrous or pubescent. Sheaths open, pubescent or glabrous; auricles present or absent; ligules

hyaline, truncate, erose; blades flat to more or less involute, more or less pubescent on both sides. Inflorescences usually spikelike racemes, sometimes spikes, all customarily called spikes, with 3 spikelets at each node, central spikelets usually sessile, sometimes pedicellate, pedicels to 2 mm long, lateral spikelets usually pedicellate, pedicels curved or straight, sometimes all 3 spikelets sessile in cultivated plants; disarticulation usually in the rachises, the spikelets falling in triplets, cultivated forms generally not disarticulating. Spikelets with 1 floret; glumes awn-like, usually exceeding the floret. Lateral spikelets usually sterile or staminate, often bisexual in cultivated forms; florets pedicellate, usually reduced; lemmas awned or unawned. Central spikelets bisexual; florets sessile; rachillas prolonged beyond the floret; lemmas ovate, glabrous to pubescent, 5-veined, usually awned, rarely unawned; paleas almost equal to the lemmas, narrowly ovate, keeled; lodicules 2, broadly lanceolate, margins ciliate; anthers 3, usually yellowish. Caryopsis usually tightly enclosed in the lemma and palea at maturity. 2n = 14, 28, 42.

Hordeum is a genus of 43 species that grow in temperate and subtropical areas at elevations from 0 to 4,500 m. The genus is native to Eurasia, the Americas, and Africa and has been introduced to Austral Asia.

KEY TO SPECIES OF HORDEUM

- 1. Auricles to 8 mm long, well-developed even on the upper leaves; lemmas of the lateral florets 6–15 mm long.

 - 2. Rachises usually not disarticulating at maturity; glumes of the central spikelets pubescent; lemmas of the central florets at least 3 mm wide, unawned or with awns 30–180 mm long; usually 1 or both lateral spikelets at a node seed-forming

 H. vulgare
- 1. Auricles usually absent or to 0.3 mm long; lemmas of the lateral florets 1.7–8.5 mm long.

184. Hordeum murinum* L., Sp. Pl 1: 85. 1753.

FIGURE 134

Annual; loosely tufted. Culms to 110 cm tall, usually erect, sometimes almost prostrate; nodes glabrous. Lower sheaths often completely surrounding the culms, glabrous or somewhat pilose; ligules 1-4 mm long; auricles to 8 mm long, well-developed even on the upper leaves; blades to 28 cm long, usually flat, occasionally with involute margins, glabrous or sparsely pilose, sometimes scabrous. Spikes 3-8 cm long, 7-16 mm wide, pale green to distinctly reddish, especially the awns; rachises disarticulating at maturity. Central spikelets sessile, florets sessile or pedicellate, pedicels to 2 mm long; glumes 11-25 mm long, 0.8-1.8 mm wide, flattened, margins usually distinctly ciliate; lemmas 8-14 mm long, to 2 mm wide, more or less smooth, awned, awns 20-40 mm; lodicules glabrous or with 1+ cilia; anthers 0.2-3.2 mm long, gray to yellow, sometimes with purple spots. Lateral spikelets staminate, floret sessile; glumes flattened, margins ciliate; lemmas 8-15 mm long, awned, awns 20-50 mm long; paleas 8–15 mm long; rachillas 2.5–6.5 mm long, slender or gibbous, yellow. 2n = 14, 28, 42.

DISTRIBUTION AND HABITAT. Hordeum murinum is native to Eurasia, where it is a common weed in areas of human disturbance. It is thought to have been introduced to the Western Hemisphere along seasides, sandy riverbanks, and animal watering holes. It is now an established weed in southwestern North America and other scattered locations.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Juárez: en el Parque "El Chamizal", maleza de prados & canales de riego [grass meadows and irrigation canals], 7 Sep 1995, 1120 m, R. 185. Hordeum pusillum Nutt., Gen. N. Amer. Pl. 1: 87. 1818.

Annual; loosely tufted. Culms 10-60 cm long, erect, geniculate, or ascending; nodes glabrous. Sheaths glabrous or slightly pubescent; ligules 0.2-0.8 mm long; auricles absent; blades to 10.5 cm long, to 4.5 mm wide, sparsely to densely pubescent on both sides. Spikes 2-9 cm long, 3-7 mm wide, erect, often partially enclosed at maturity, pale green. Glumes straight, not divergent at maturity. Central spikelets: glumes 8-17 mm long, 0.5-1.5 mm wide, distinctly flattened near the base; lemmas 5-8.5 mm long, usually glabrous, sometimes sparsely to densely pubescent, awned, the awns 3.5-9.5 mm long; anthers 0.7-1.8 mm long. Lateral spikelets usually sterile; glumes to 18 mm long; lower glumes distinctly flattened, more or less winged basally; lemmas 2.5-5.7 mm long, usually awned, awns to 1.8 mm long, rarely unawned; anthers 0.6-1.2 mm long, 2n = 14.

DISTRIBUTION AND HABITAT. Hordeum pusillum grows in open grasslands, pastures, the borders of marshes, and disturbed places such as roadsides and waste places, often in alkaline soil. It is native, widespread, and often common in much of the United States to northern Mexico, where it is uncommon.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: La Campana, 26 May 76, Jardines de observación [observation gardens], 1540 m, *S. González* 833 (RELC).

186. Hordeum vulgare* L., Sp. Pl. 1: 84-85. 1753.

FIGURE 135

Plants summer or winter annual; loosely tufted. Culms to 100(150) cm long, usually erect; nodes glabrous. Lower sheaths pilose, upper sheaths glabrous, auricles to 6 mm long, well-developed even on the upper leaves; blades to 30 cm long, 5–15 mm wide, flat, scabrous or glabrous. Spikes 5–10 cm long, 0.8–2 cm wide, green to purplish or blackish; nodes 10–30, with 3 spikelets per node, 0–2 lateral spikelets, in addition to the central spikelets, forming seed at maturity (resulting in 2-, 4-, and 6-rowed barley); rachises usually not disarticulating at maturity.

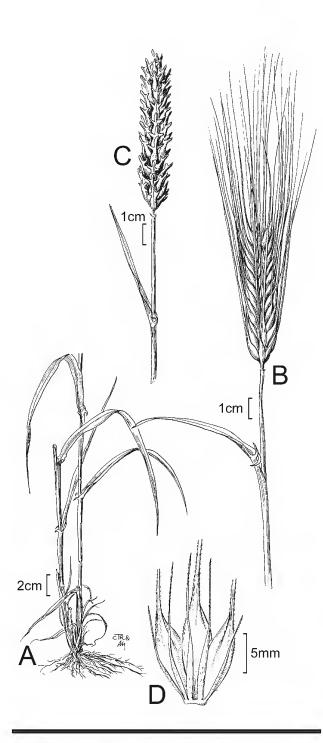

FIGURE 135. Hordeum vulgare. A. Habit. B. Inflorescence, awned form. C. Inflorescence, unawned form. D. Spikelet fascicle with three spikelets. Drawn by Cindy Roché and Annaliese Miller; copyright Utah State University.

Central spikelets sessile; glumes 10–30 mm long, pubescent, flattened near the base; lemmas 6–12 mm long, 3+ mm wide, glabrous, sometimes scabrous, particularly distally, unawned or awned, awns 30–180 mm long, usually scabrous; anthers 6–10 mm long, yellowish. Lateral spikelets usually sessile if seedforming, pedicellate if sterile; pedicels up to 3 mm long; lemmas usually 6–15 mm long, awned when fertile, obtuse to acute when sterile. 2n = 14 (28).

DISTRIBUTION AND HABITAT. Hordeum vulgare is native to Eurasia. Plants in Mexico belong to the cultivated subspecies, *Hordeum vulgare* subsp. vulgare, and are found as an adventive in fields, roadsides, and disturbed habitats.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Práxedis G. Guerrero (San Ignacio): a 2 km al S del poblado del mismo nombre [village of the same name], Rancho Escuela de la Univ. Autónoma de Cd. Juárez, 18 Mar 1995, 1090 m, R. Corral, P. Olivas & E. Pérez RCD6032 (UACJ).

Imperata Cirillo

Perennial; strongly rhizomatous. Culms mostly erect and unbranched, usually with 3-4 nodes. Leaves not aromatic; sheaths open, ciliate at the margins of the collars; ligules membranous; blades of the basal leaves linear to lanceolate, sometimes ciliate basally, those of the cauline leaves reduced. Inflorescences terminal, cylindrical to conical panicles with an evident rachis; rachises often with numerous long hairs; inflorescence branches usually shorter than the rachises, with spikelets in unequally pedicellate pairs; disarticulation below the glumes. Spikelets homogamous and homomorphic, unawned; calluses very short, hairy. Glumes equal to subequal, membranous, 3- to 9-veined, with hairs longer than the florets over at least the lower 1/2; lower florets reduced to hyaline or membranous lemmas; upper florets bisexual, lemmas, if present, hyaline, unawned; anthers 1–2, yellow to brown; stigmas elongate, purple to brown; styles connate or free. Pedicels not fused to the branch axes, terminating in cuplike tips. Caryopsis ovate to obovate, light to dark brown. x = 10.

Imperata has 13 species and is widely distributed in warm regions of both hemispheres.

187. Imperata brevifolia Vasey, Bull. Torrey Bot. Club 13(2): 26. 1886.

FIGURE 136

Culms 51–129 cm tall. Ligules 0.7–2.9 mm long; blades 7–14 mm wide, linear to lanceolate, abaxial surfaces smooth, adaxial surfaces sometimes densely pilose basally, otherwise scabrous. Panicles 16–34 cm long, dense; lower branches 2–5 cm long, divergent. Spikelets with callus hairs 8–12 mm long; glumes 2.7–4.1 mm long; lower lemmas 2.5–3.9 mm long, membranous, glume-like; upper lemmas 1.4–2.4 mm long, completely surrounding the ovary; stamens 1, filaments dilated at the base; anthers 1.3–2.3 mm long, yellow to orange; styles 0.9–2.4 mm long; stigmas 2.1–4 mm long, purple to brown. 2*n* = 20.

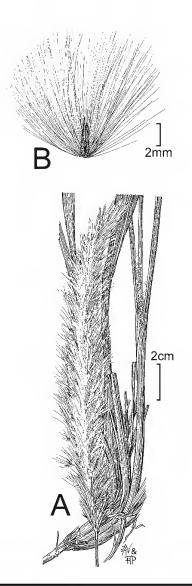

FIGURE 136. Imperata brevifolia. A. Habit. B. Spikelet. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

DISTRIBUTION AND HABITAT. Imperata brevifolia is native to wet or moist sites in the southwestern deserts of California, Nevada, and Utah to western Texas. Our only record of this species is a LeSueur collection (Mex-099), and we cannot verify its locality. We do know that his next number, Mex-0100 (Andropogon glomeratus var. pumilus), was collected on the same date and locality.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Rio Bonito hot country, 26 Aug 1936, H. LeSueur 099 (US).

Kalinia H. L. Bell & Columbus

Robust perennial; with long, glabrous stolons and thick, tan to golden rhizomes with imbricate scales dehiscing to form distinctive scars. Culms erect; ligule a line of short hairs; leaf blades rigid, conspicuously orthodistichous, with markedly pungent tips. Inflorescence a narrow to open panicle. Spikelets with 4–12-hermaphroditic florets, the distal floret occasionally reduced; lemmas 3-veined, glabrous, with an obtuse to slightly pointed tip, sometimes erose, fringed, or mucronate from the central vein.

Kalinia is a new monotypic genus and subtribe to house *Eragrostis obtusiflora* (E. Fourn.) Scribn., a long-misplaced species that is sister to the Monanthochloinae + Boutelouinae (Bell et al., 2012; Peterson and Valdés-Reyna, 2005; Peterson et al., 2016, 2017).

188. *Kalinia obtusiflora* (E. Fourn.) H. L. Bell & Columbus, Aliso 30(2): 91. 2012. *Brizopyrum obtusiflorum E. Fourn.*, Mexic. Pl. 2: 120. 1886. *Eragrostis obtusiflora* (E. Fourn.) Scribn., Bull. Div. Agrostol. U.S.D.A. 8: 10, t. 5. 1897.

FIGURE 137

Perennial; with scaly, sharp-pointed rhizomes, with innovations, sometimes stoloniferous, the sharp-tipped rhizomes 4-8 mm thick. Culms 15-40(50) cm tall, stiff, hard, glaucous below the nodes. Sheaths hairy at the apex, hairs to 2 mm; ligules 0.2-0.4 mm long; blades 2-15 cm long, (1)2-4 mm wide, involute, arcuate, glabrous abaxially, scabrous adaxially, apex sharply pointed. Panicles 6-20(24) cm long, 2-8(12) cm wide, ovate, open or contracted; primary branches 1-8(15) cm long, appressed or diverging up to 50° from the rachises; pulvini glabrous or not; pedicels 0-8 mm long, appressed, lower pedicels on each branch shorter than 1 mm long. Spikelets 8-14 mm long, 1.4-3 mm wide, ovate to lanceolate, stramineous with a reddish-purple tinge; disarticulation basipetal, glumes persistent; glumes unequal, chartaceous; lower glumes 2.4–3.6 mm long; upper glumes 3-4.5 mm long, sometimes 3-veined; lemmas 3.8-4.5 mm long, ovate, leathery, lateral veins evident, greenish, upper margins hyaline, apex acute to obtuse, usually erose; paleas 3.8-4.5 mm long, membranous, keels scaberulous, apex obtuse to truncate; stamens 3; anthers 2-2.4 mm long, purplish to yellowish. Caryopsis 1.6-2 mm long, ellipsoid, dorsally flattened, with a shallow adaxial groove, striate, reddish-brown. 2n = 40.

DISTRIBUTION AND HABITAT. *Kalinia obtusiflora* is native to the southwestern United States and Mexico. It grows in dry or wet alkali flats, often in association with *Distichlis spicata*, at 900–1,400 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ascensión: Laguna Ascension, near La Ascension, 13 Sep 1939, L. H. Harvey 1750 (US). Chihuahua: La Campana, Potrero La Reserva; 12 km carr. Koeleria Pers.

Perennial; usually caespitose, sometimes short rhizomatous. Culm erect. Sheaths open; auricles absent; ligules membranous; blades flat to involute, pubescent or glabrous. Inflorescences panicles, usually dense and spikelike, sometimes lax, stiffly and narrowly pyramidal at anthesis; main rachis and branches pubescent. Spikelets laterally compressed, with 2-4 florets; rachillas to 1 mm long, glabrous or pubescent, usually prolonged beyond the distal florets, or bearing a vestigial floret; disarticulation above the glumes and beneath the florets. Glumes subequal to or slightly exceeding the lemmas, membranous, scabrous to tomentose, keels sometimes ciliate; lower glumes 1-veined, somewhat narrower and shorter than the upper glumes; upper glumes obscurely 3(5)-veined; calluses with or without hairs; lemmas thin, membranous, 5-veined, margins shining, scarious, apex acute, sometimes mucronate or awned; paleas equaling or subequal to the lemmas, hyaline; lodicules 2, glabrous, toothed; anthers 3; ovaries glabrous. Caryopsis glabrous. x = 7.

Koeleria is a cosmopolitan genus of about 49 species that grow in dry grasslands and rocky soils; a single species is native to North America.

189. Koeleria pyramidata (Lam.) P. Beauv., Ess. Agrostogr. 84: 166, 175. 1812. Poa pyramidata Lam., Tabl. Encycl. 1: 183. 1791.

Koeleria macrantha (Ledeb.) Schult., Koeleria cristata Pers., Koeleria californica (Domin) Beetle.

FIGURE 138

Plants loosely caespitose, sometimes rhizomatous. Culms (20)20–90(130) cm tall, glabrous or puberulent above. Sheaths sparsely sericeous to densely pubescent, old sheaths persistent, disintegrating into wavy, curled, or arched fibers; ligules 0.5–2 mm long; blades 2–24 cm long, (0.5)1–5 mm wide, flat, often involute when dry, glabrous or hairy, scaberulous, margins of the basal blades often ciliate below, with hairs usually more than 2 mm. Panicles 4–27 cm long, (0.5)1–3(5) cm wide; branches finely pubescent to villous. Spikelets 2.5–10 mm long, with 2–4(5) florets; rachillas with scattered pubescence; glumes 2.5–6 mm long, glabrous, smooth or scabrous, apex acute; lower glumes 2.5–5 mm long, 1-veined; upper glumes generally

FIGURE 138. Koeleria pyramidata. A. Habit. B. Inflorescence branches. C. Glumes. D. Floret. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

4–6 mm long, 3-veined; calluses broadly rounded, pubescent; lemmas (2.5)4–6.5 mm long, glabrous or puberulent, rarely ciliate, sometimes scabrous, green when young, stramineous at maturity, sometimes purplish-tinged, apex acuminate to mucronate; anthers 1–2.5(3) mm long. Caryopsis 2.5–3.8 mm long. 2n = 14, 28.

Koeleria pyramidata, as interpreted here, is a highly polymorphic species complex and has been treated as Koeleria pyramidata subsp. pyramidata by Quintanar and Castroviejo (2014), who studied the genus in the western Mediterranean Basin and Macaronesia. They found variability in organ size and hairiness. In addition, we have preliminary DNA sequence data (P. Barberá at Real Jardín Botánico, and K. Romaschenko, P. M. Peterson and R. J. Soreng at Smithsonian Institution; unpublished) confirming the highly variable nature of accessions previously referred to as K. pyramidata or K. macrantha.

DISTRIBUTION AND HABITAT. Koeleria pyramidata is widely distributed in temperate regions of North America and Eurasia. In North America it grows in semi-arid to mesic conditions on dry prairies or in grassy woods, generally in sandy soil, at 1,500–3,900 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: 32 km W of hwy 45 towards Benito Juárez, 17 Oct 1992, pinyon-juniper woodlands, 2110 m, *P.M. Peterson & Annable 12549* (US). Gómez Ruíz* (CIIDIR, US).

Lasiacis (Griseb.) Hitchc.

Perennial (rarely annual); caespitose. Culms weakly lignified, erect, arching, climbing, or decumbent, rooting at the nodes. Sheaths open; ligules membranous, sometimes ciliate; pseudopetioles sometimes present; blades linear to ovate, bases slightly to strongly asymmetric. Inflorescences open or contracted panicles, rachises usually visible, even distally, spikelets attached obliquely to the pedicels; disarticulation below the glumes. Spikelets subglobose to globose, with 2 florets. Glumes membranous, apex lanate pubescent, abruptly apiculate; lower glumes \(\frac{1}{3}\)-\(\frac{2}{3}\) as long as the spikelets, 5- to 13-veined, bases saccate, margins overlapping; upper glumes about as long as the upper florets, not saccate, 7- to 15-veined; lower florets sterile or staminate; lower lemmas membranous, apex lanate pubescent, abruptly apiculate; lower paleas present, sometimes reduced; upper florets stipitate, bisexual, appearing to be mucronate or acuminate; upper lemmas indurate, usually broadly elliptic to obovate, margins enclosing the edges of the paleas, apex obtuse, somewhat woolly pubescent, usually dark brown at maturity; upper paleas similar to the lemmas, but saccate below and gibbous above. Caryopsis plano-convex, ovoid, or nearly orbicular; embryo about $\frac{1}{2}$ as long as the caryopsis; hila oblong to nearly round. x = 9.

Lasiacis is a neotropical genus of 17 species that extends from southern Florida to Peru and Argentina; it is uncommon in Mexico.

190. Lasiacis ruscifolia (Kunth) Hitchc., Proc. Biol. Soc. Washington 24: 145. 1911. Panicum ruscifolium Kunth, Nov. Gen. Sp. (quarto ed.) 1: 101–102. 1815.

FIGURE 139

Caespitose perennial. Culms 1–8 m long, 5–12 mm thick, hollow, arching or clambering. Sheaths glabrous, puberulent, or hirsute with papillose-based hairs, margins ciliate; ligules 0.2–1 mm long, glabrous or ciliate; blades 2–16 cm long, 8–56 mm wide, ovate to ovate-lanceolate. Panicles 2–22 cm long; lower branches to 9 cm long, divergent. Spikelets 2.6–4 mm long, globose; lower glumes 1.2–2.2 mm long, 9- to 13-veined; lower florets sterile; upper glumes 11- to 13-veined; upper florets 2.8–3.6 mm long, 2–2.9 mm wide, dark brown to grayish-black at maturity; upper lemmas usually with a distinct shelf at the base, from which a sterile projection often arises; upper paleas usually deeply concave; anthers 1.4–2.3 mm long, white; stigmas white. Caryopsis 2–2.5 mm long, 2*n* = 36.

FIGURE 139. Lasiacis ruscifolia. A. Habit. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

DISTRIBUTION AND HABITAT. Lasiacis ruscifolia extends from southern Florida to Peru.

Uruachi: Guasaremos, Río Mayo, 20 Aug, 1936, Gentry 2402 (US).

Leersia Sw.

Plants usually perennial, rarely annual; terrestrial or aquatic; rhizomatous or caespitose; synoecious. Culms erect or decumbent, often rooting at the nodes, branched or unbranched. Leaves equitably distributed along the culm; sheaths open; auricles absent; ligules membranous; pseudopetioles absent; blades aerial, linear to broadly lanceolate, flat or folded, sometimes involute when dry. Inflorescences terminal panicles, usually exserted, axillary panicles sometimes also present; disarticulation beneath the spikelets. Spikelets bisexual, with 1 floret; florets laterally compressed, linear to suborbicular in sideview; glumes absent; calluses not stipelike, glabrous; lemmas and paleas subequal, chartaceous to coriaceous, ciliate-hirsute or glabrous, tightly clasping along the margins; lemmas 5-veined, obtuse or acute to acuminate, sometimes mucronate, usually unawned; paleas 3-veined, unawned; lodicules 2; anthers 1, 2, 3, or 6; styles 2, bases fused, stigmas laterally exserted, plumose. Caryopsis laterally compressed; embryos about 1/3 as long as the caryopsis; **hila** linear, x = 12.

Leersia is a genus of about 18 aquatic to mesophytic species, growing primarily in tropical and warm-temperate regions. Five species are native to North America, and three are found in Mexico.

191. Leersia hexandra Sw. Prodr. 21. 1788.

FIGURE 140

Perennial; rhizomatous, rhizomes elongate, not scaly. Culms 25–150 cm tall, 1–1.5 mm thick, decumbent, rooting at the nodes, terminal portions erect, often floating, branched or unbranched; nodes pubescent, adjacent portions of the internodes glabrous or coarsely scabrous. Sheaths glabrous or coarsely scabrous, margins often ciliate; ligules 1–3 mm long; blades 5–25 cm long, 3–15 mm wide, ascending, glabrous or pubescent. Panicles 5–15 cm long, exserted at maturity, with 1(2) branches per node; branches 3–10 cm long, appressed to ascending, spikelet-bearing to near the base, spikelets appressed to slightly divergent, slightly imbricate. Spikelets 3.2–4.7(5) mm long, 0.5–2 mm wide, ovate to elliptic. Lemmas ciliate on the keels and margins, short hirsute or glabrous elsewhere, apex acute to acuminate; paleas ciliate on the keels; stamens 6, anthers 2–3.2 mm long. Caryopsis about 2mm long, usually not developed. 2n = 48.

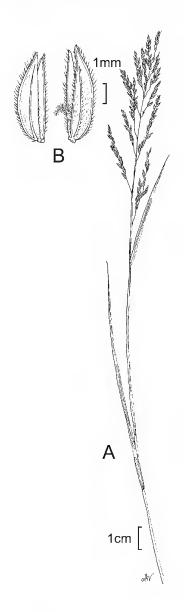

FIGURE 140. *Leersia hexandra*. A. Culm and inflorescence. B. Two spikelets. Drawn by Linda Ann Vorobik; copyright Utah State University.

DISTRIBUTION AND HABITAT. Leersia hexandra is found in wet areas, usually in freshwater along streams and ponds, where it sometimes forms floating mats. It grows in the Americas throughout much of the neotropics.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000).

Leptochloa P. Beauv.

Perennial; caespitose, sometimes stoloniferous. Culms herbaceous, solid, glabrous. Sheaths open, rounded; ligules membranous, ciliate, cilia longer than the membranous base, conspicuous tufts of stiff hairs present on either side of the ligules; blades linear, flat or folded. Inflorescences terminal, panicles of nondisarticulating spikelike branches, exceeding the leaves; branches in 1 or more whorl(s), spikelets in 2 rows on the abaxial side of the branches, axes terminating in a functional spikelet. Spikelets laterally or dorsally compressed, with 2-5 florets, lowest 1-2 florets bisexual, distal 1-3 florets progressively reduced and sterile; disarticulation above the glumes, all the florets falling as a unit; glumes much shorter than the spikelets, membranous; lower glumes linear, acuminate; upper glumes lanceolate-ovate, awned; calluses bearded; lowest lemmas linear-lanceolate, 3-veined, veins prolonged into 3 awns; central awns longer than lateral awns; paleas 2-keeled, acute; distal floret(s) 1- to 3-awned; lodicules 2; anthers 2 or 3. Caryopsis sulcate; embryos ½ as long as the carvopsis; hila punctate, x = 10.

Leptochloa has seven species, two of them are native to the Americas (Peterson et al., 2015). Both species of Leptochloa in Chihuahua have a disjunct distribution with populations in North America being widely separated from those in South America.

KEY TO SPECIES OF LEPTOCHLOA

- 1. Lowest lemma awns unequal, the central awns 8-12 mm long, the lateral awns 0.5-1.5 mm long L. pluriflora
- 192. Leptochloa crinita (Lag.) P. M. Peterson & N. Snow, Ann. Bot. 109: 1327. 2012. Chloris crinita Lag., Varied. Ci. 2(4): 143. 1805. Trichloris crinita (Lag.) Parodi, Revista Argent. Agron. 14(1): 63. 1947.

Perennial; caespitose, sometimes stoloniferous. Culms to 100 cm tall. Sheaths glabrous or sparsely hirsute; ligules to 3 mm; blades to 20 cm long, 5–10 mm wide, scabrous. Panicles with 6–20 branches in several closely spaced whorls, appearing as a single terminal cluster; branches to 15 cm long, erect, with 7–9

spikelets per cm. Spikelets with 1 bisexual and 1(2) sterile floret(s); lower glumes 0.8–1.1 mm long; upper glumes 2–2.5 mm long, awned, awns to 2 mm; lowest lemmas 2.4–3.8 mm long, about 0.5 mm wide, narrowly lanceolate to elliptic, scabrous, particularly distally, apex bilobed and 3-awned, central awns 8–12 mm long, equaling or slightly longer than the 5–12 mm lateral awns; first sterile florets 1–1.5 mm long, narrowing to 3 subequal 5–7 mm awns; second sterile florets, if present, similar but smaller. Caryopsis 1.7–2.3 mm long, strongly dorsally flattened. 2*n* = 40.

DISTRIBUTION AND HABITAT. Leptochloa crinita is a native species that grows in the southwestern United States and northern Mexico, and it is disjunct in northern Argentina.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: aprox. 25 km al N del poblado [village] Flores Magón, 7 Oct 1995, 1140 m, R. Corral, P. Olivas & J.O. Torres RCD6482 (UACJ). Meoqui: In town of Meoqui, along hwy 45, SE of city of Chihuahua, 25 Sep 2004, 1140 m, R.M. King & R.M. Garvey 13463 (CIIDIR).

193. Leptochloa pluriflora (E. Fourn.) P. M. Peterson & N. Snow, Ann. Bot. 109: 1327. 2012. Trichloris pluriflora E. Fourn., Mexic. Pl. 2: 142. 1886. Chloris pluriflora (E. Fourn.) Clayton, Kew Bull. 21: 102. 1967.

Perennial; stoloniferous or caespitose. Culms to 150 cm tall. Sheaths glabrous or sparsely hirsute; ligules to 3 mm; blades to 30 cm long, to 10 mm wide, scabrous or sparsely hirsute. Panicles with 7-20 branches in a few, evidently separate whorls; branches to 20 cm long, ascending, with 7-9 spikelets per centimeter. Spikelets with 1-2 bisexual florets, a third floret with a rudimentary pistil and stamens sometimes present below the (1)2-3 sterile florets; lower glumes 2-3 mm long; upper glumes 3-5 mm long; lowest lemmas 3-5 mm long, mostly glabrous, margins short-ciliate near the middle, sparsely scabrous distally, apex 3-awned, central awns 8-12 mm long, lateral awns 0.5-1.5 mm long; lowest sterile florets 1.5–3 mm long, about 0.3 mm wide, mostly glabrous, margins sometimes short-ciliate near the middle, apex 3-awned, central awns to 8 mm long, lateral awns mucronate. Carvopsis 1.8-2.2 mm long, strongly dorsally compressed to trigonous in transverse section. 2n = 80.

DISTRIBUTION AND HABITAT. Leptochloa pluriflora is native from southern Texas to Guatemala and disjunct in Ecuador to Argentina.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

Lolium L.

Annual or perennial; caespitose, sometimes short rhizomatous. Culms slender to stout, erect to decumbent, rarely prostrate. Sheaths open, rounded, glabrous, sometimes scabrous; ligules membranous, glabrous; auricles sometimes present; blades flat, linear. Inflorescences distichous spikelike or paniculate. Inflorescence a spike, with solitary spikelets oriented edgewise to the rachis, perpendicular to the rachis concavities or panicles, open and much branched. Spikelets laterally compressed, with 2-22 florets, distal florets reduced; rachillas glabrous; disarticulation above the glumes. Glumes usually 1 or 2, lanceolate to oblong, rounded over the midvein, membranous to indurate, 3- to 9-veined, unawned; lower glumes absent from all but the terminal spikelet in plants with spike inflorescences or both glumes present in plants with open panicles; calluses short, blunt, glabrous or sparsely hairy; lemmas lanceolate, ovate or oblong, rounded over the midvein, membranous, chartaceous, 3- to 7-veined, apex sometimes hyaline, unawned or awned, awns subterminal, more or less straight; paleas membranous, usually smooth, keels ciliolate; lodicules 2, free, lanceolate to ovate; anthers 3; ovaries glabrous. Caryopsis dorsally compressed, oblong, broadly elliptic or ovate, longitudinally sulcate; hila linear, in the furrow; embryos 1/5-1/3 as long as the caryopsis. x = 7.

Lolium comprises 11 species that are native to Europe, temperate Asia, and northern Africa. All have been introduced to North America, often as forage grasses.

KEY TO SPECIES OF LOLIUM

- 1. Inflorescence a spike with solitary spikelets oriented edgewise to the rachises; most spikelets, except the very terminal ones, with a single glume; summit of leaf sheaths without auricles.
 - 2. Plants long-lived perennials; 2–10 florets per spikelet; lemmas unawned or awned, awns to about 8 mm long L. perenne

194. Lolium arundinaceum* (Schreb.) Darbysh., Novon 3(3): 241. 1993. Festuca arundinacea Schreb., Spic. Fl. Lips. 57. 1771. Schedonorus arundinaceus (Schreb.) Dumort., Observ. Gramin. Belg. 106. 1824.

FIGURE 141

Perennial; sometimes rhizomatous. Culms to 1.5(2) m tall. Leaves convolute in young shoots; auricles ciliate, having at

least 1 or 2 hairs along the margins; ligules 1(2) mm long; blades 11–30 cm long, 4–12 mm wide. Panicles 10–35 cm; branches at the lowest node usually 2, shorter branch with (1)2–9(13) spikelets, longer branch with (3)4–13(19) spikelets. Spikelets 8–15.5 mm long, 2–3.5 mm wide, with 3–6(9) florets; lower glumes 3–6 mm long; upper glumes 4.5–7(9) mm long; lemmas (4)5–9(11.5) mm long, usually scabrous or hirsute, at least distally, rarely smooth, awns absent or to 4 mm long, terminal or

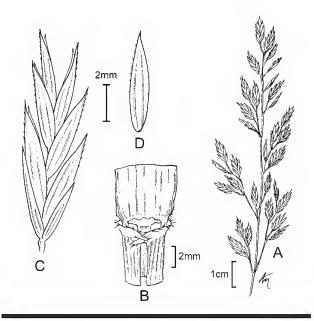

FIGURE 141. Lolium arundinaceum. A. Inflorescence. B. Ligule. C. Spikelet. D. Lemma. Drawn by Annaliese Miller; copyright Utah State University.

attached up to 0.4 mm below the apex; paleas slightly shorter than to slightly longer than the lemmas; anthers 2.5–4 mm long. Caryopsis 2–4 mm long, 0.9–1.6 mm wide. 2n = 28, 42, 56, 63, 70.

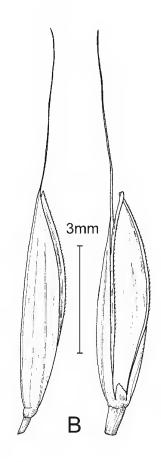

DISTRIBUTION AND HABITAT. Lolium arundinaceum is a Eurasian species that has been introduced to North America. It is grown for forage, soil stabilization, and coarse turf. It is now cultivated in all but the coldest and most arid parts of North America and often escapes.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ocampo: Near Mirador de Cascada de Basaseachic, 7 Sep 2008, slopes with *Pinus*, 2022 m, *P.M. Peterson & J.M. Saarela* 22100 (US).

195. Lolium multiflorum* Lam., Fl. Franc. 3: 621. 1779.

FIGURE 142

Annual or short-lived perennial. Culms to 150 cm. Leaves rolled in the bud; blades usually 10–30 cm long, (2)3–8 (13) mm wide. Spikes 15–45 cm long, with 5–38 spikelets; rachises 0.8–2 mm thick at the nodes, not flexuous. Spikelets 8–31 mm long, 2–10 mm wide, with (10)11–22 florets; glumes 5–18 mm long, ½–½ as long as the florets, membranous to indurate; lemmas 4–8.2 mm long, 1–2 mm wide, usually awned, awns to 15 mm long, attached 0.2–0.7 mm below the apex, rarely unawned; paleas shorter than to slightly longer than the lemmas; anthers

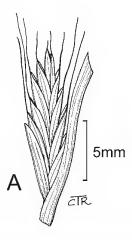

FIGURE 142. *Lolium multiflorum*. A. Spikelet. B. Florets. Drawn by Cindy Roché; copyright Utah State University.

(2.5)3-4.5(5) mm long. Caryopsis 2.5–4 mm long, 0.7–1.5 mm wide, 3 or more times longer than wide. 2n = 14.

DISTRIBUTION AND HABITAT. Lolium multiflorum, a European species, now grows in most of North America. It is planted as a cover crop, as a temporary lawn grass, for roadside restoration, and for soil or forage enrichment; it often escapes from cultivation, becoming established in disturbed sites.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: La Campana, Ojo del Arco, 11 Sep 1973, 1500 m, *Valdés-Reyna VR-188* (ENCB, RELC); Rancho Experimental La Campana, Jardín de observación de zacates [grass observation garden], 17 May 1975, 1500 m, *Valdés-Reyna VR-902* (ENCB, RELC).

196. Lolium perenne* L., Sp. Pl. 1: 83. 1753.

FIGURE 143

Plants long-lived perennial. Culms to 100 cm. Leaves folded in the bud; blades usually 10–30 cm long, (1)2–4(6) mm wide. Spikes 3–30 cm long, with 5–37 spikelets; rachises 0.5–2.5 mm thick at the nodes, often flexuous. Spikelets 5–22 mm long, 1–7 mm wide, with (2)5–9(10) florets; glumes 3.5–15 mm long, ($\frac{1}{3}$) $\frac{1}{2}$ – $\frac{3}{4}$ as long as to slightly exceeding the distal florets, membranous to indurate; lemmas 3.5–9 mm long, 0.8–2 mm wide, unawned or awned, awns to about 8 mm long, attached 0.2–0.7 mm below the apex; paleas shorter than to slightly longer than the lemmas; anthers 2–4.2 mm long. Caryopsis 3–5.5 mm long, 0.7–1.5 mm wide, 3 or more times longer than wide. 2n = 14.

DISTRIBUTION AND HABITAT. Lolium perenne, a Eurasian species, is now established in disturbed areas throughout much of North America. It is commercially important, being included in lawn seed mixtures as well as being used for forage and erosion prevention.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Práxedis G. Guerrero (San Ignacio): a 2 km al S del poblado del mismo nombre [village of the same name], Rancho Escuela de la Univ. Autónoma de Cd. Loya IEA7 (UACJ).

Luziola Juss

Perennial; aquatic, usually rooted, sometimes floating; stoloniferous, sometimes mat-forming; monoecious. Culms erect or prostrate, sometimes rooting at the nodes, branched, emergent or immersed. Leaves cauline; sheaths open, not inflated or somewhat inflated; ligules hyaline; pseudopetioles present or absent; blades flat, linear to lanceolate or narrowly elliptic, glabrous, pubescent, or scabrous. Inflorescences panicles, racemes, or spikes, exserted or enclosed, staminate and pistillate spikelets usually in separate inflorescences, pistillate inflorescences at the lower or middle nodes, staminate inflorescences

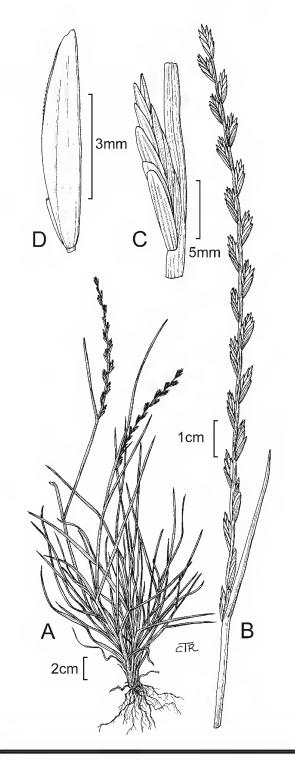

FIGURE 143. Lolium perenne. A. Habit. B. Inflorescence. C. Spikelet. D. Floret. Drawn by Cindy Roché; copyright Utah State University.

usually terminal; disarticulation below the spikelets. Spikelets unisexual, laterally compressed to subterete, with 1 floret; glumes absent; calluses glabrous; lemmas and paleas subequal, ovate or lanceolate, membranous or hyaline, unawned; lodicules 2; staminate lemmas and paleas obscurely few- to several-veined; anthers 6–16; pistillate lemmas 5- to 14-veined, margins not clasping the margins of the paleas, unawned; paleas 3- to 10-veined; styles 2, bases fused, stigmas laterally or terminally exserted, plumose. Fruits achenes, ovoid, ellipsoid, or subglobose, beaked by the persistent style bases; pericarps shell-like, partially free from the seed, smooth or striate, crustaceous; seeds ovoid to subglobose; embryos basal; hila linear. x = 12.

Luziola is a genus of 11 species that range from the southeastern United States to Argentina (Clayton et al., 2006). Only L. fluitans is native to North America.

197. Luziola fluitans (Michx.) Terrell & H. Rob., Bull. Torrey Bot. Club 101(5): 244. 1974. Zizania fluitans Michx., Fl. Bor.-Amer. 1: 75. 1803.

Hydrochloa caroliniensis P. Beauv.

FIGURE 144

Plants stoloniferous; mostly immersed. Culms to 1+ m long, to 2 mm thick; bases prostrate and rooting at the nodes. Leaves mainly cauline, usually crowded distally, streaming in the current

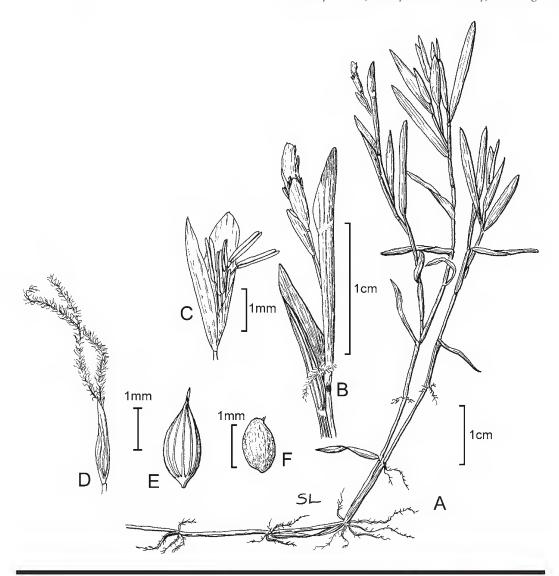

FIGURE 144. Luziola fluitans. A. Habit. B. Culm. C. Staminate floret. D. Immature pistillate floret. E. Mature pistillate floret. F. Achene. Drawn by Sandy Long; copyright Utah State University.

or floating on the surface, distal leaves sometimes emergent; **sheaths** glabrous; **ligules** 0.5-2 mm long, subtriangular to truncate, sometimes erose; **pseudopetioles** sometimes present; **blades** 1-5(8) cm long, 1-4 mm wide, glabrous, sometimes pilose basally, scaberulous. **Inflorescences** spikes or racemes, spikelets sessile or shortly pedicellate. **Staminate inflorescences** 1-2 cm long, terminal, partially exserted from the sheaths, emergent at anthesis, with 2-4 spikelets; **staminate florets** 3-5 mm long; **lemmas** narrowly ovate, usually 5-veined; **paleas** similar, usually 3-veined; stamens 6, anthers 2-3.7 mm long, linear. **Pistillate inflorescences** 0.5-2 cm long, mostly included in the subtending sheaths, only the stigmas visible, with 2-4 spikelets; **pistillate florets** 1.4-3 mm long, caducous; **lemmas** 5- to 9-veined, acuminate; **paleas** similar to the lemmas, 3- to 7-veined; **stigmas** 3-6 mm long. **Achenes** 1.3-2 mm long, ovoid, asymmetrical, minutely striate, lustrous. 2n = 24.

DISTRIBUTION AND HABITAT. Luziola fluitans grows in fresh to slightly saline lakes and streams in the southeastern United States and Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

Melica L.

Perennial; caespitose or soboliferous, not or only short rhizomatous. Culms sometimes forming a basal corm; nodes and

internodes usually glabrous. Sheaths closed almost to the top; auricles sometimes present; ligules thinly membranous, erose to lacerate, usually glabrous, those of the lower leaves shorter than those of the upper leaves; blades flat or folded, glabrous or hairy, particularly on the adaxial surfaces, sometimes scabrous. Inflorescences terminal panicles; primary branches often appressed; secondary branches appressed or divergent; pedicels either more or less straight or sharply bent below the spikelets, scabrous to strigose distally; disarticulation below the glumes in species with sharply bent pedicels, above the glumes in other species. Spikelets with 1-7 bisexual florets, terminating in a sterile structure, the rudiment, composed of 1-4 sterile florets; rudiments sometimes morphologically distinct from the bisexual florets, sometimes similar but smaller; glumes chartaceous or papery, distal margins wide, translucent; lower glumes 1- to 9-veined; upper glumes 1- to 11-veined; calluses glabrous; lemmas membranous basally, sometimes becoming coriaceous at maturity, glabrous or with hairs, (4)5- to 15-veined, usually unawned, sometimes awned, awns to 12 mm long, straight; paleas from ½ as long as to almost equaling the lemmas, keels usually ciliate; lodicules fused into a single, collarlike structure extending ½-2/3 around the base of the ovaries; anthers (2)3. Caryopsis smooth, glabrous, longitudinally furrowed, falling from the floret when mature. x = 9.

Melica includes 92 species, which grow in temperate regions of the world but is absent from Australia (Soreng et al., 2017b).

KEY TO SPECIES OF MELICA

- 198. Melica montezumae Piper, Proc. Biol. Soc. Wash. 18: 144. 1905.

FIGURE 145

Plants caespitose, not rhizomatous. Culms 14–100 cm tall, not forming corms; internodes smooth. Sheaths glabrous or scabrous; ligules 2.5-7 mm long; blades 1.2-3 mm wide, abaxial surfaces glabrous, scaberulous, adaxial surfaces puberulent. Panicles 5-25 cm long; branches 1-5 cm long, appressed to reflexed, straight, with 2-9 spikelets; pedicels sharply bent below the spikelets; disarticulation below the glumes. Spikelets 6-8 mm long, with 1 bisexual floret; lower glumes 5.5-8 mm long, 1.8-3 mm wide, 5-veined; upper glumes 5-8 mm long, 0.7-1.5 mm wide, 3- to 5-veined; lemmas 4.5-8 mm long, 9- to 15-veined, veins prominent, tuberculate, proximal portion with flat, twisted hairs, distal portion glabrous, chartaceous, apex emarginate to acute, unawned; paleas about 34 the length of the lemmas; anthers 1.5-3 mm long; rudiments 2-3 mm long, obovoid or obconic, clublike, not resembling the bisexual florets. 2n = 18.

DISTRIBUTION AND HABITAT. *Melica montezumae* grows primarily in shady locations in the mountains of west Texas and adjacent Mexico. SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Chihuahua, 1885, E. Wilkinson 342 (US). Jiménez: Santa Eulalia Mts, 6 Apr 1885, C.G. Pringle 430 (US).

199. *Melica porteri* Scribn., Proc. Acad. Nat. Sci. Philadelphia 37: 44, t. 1, f. 17–18. 1885.

FIGURE 146

Plants not or loosely caespitose, short rhizomatous. Culms 55–100 cm tall, not forming corms; internodes smooth, basal internodes not thickened. Sheaths often scabrous on the keels, otherwise smooth; ligules 1–7 mm long; blades 2–5 mm wide, both surfaces glabrous, scaberulous. Panicles 13–25 cm; branches 1–9 cm long, straight and appressed or flexible and ascending to strongly divergent, with 1–12 spikelets; pedicels sharply bent below the spikelets; disarticulation below the glumes. Spikelets 8–16 mm long, 1.5–5 mm wide, parallel-sided when mature, with 2–5 bisexual florets; rachilla internodes 1.9–2.1 mm long; glumes green, pale, or purplish-tinged; lower glumes 3.5–6 mm long, 2–3 mm wide, 3- to 5-veined; upper glumes 5–8 mm long, 2–3 mm wide, 5-veined; lemmas 6–10 mm long, glabrous, chartaceous on the distal ½, 5- to 11-veined, veins conspicuous, apex rounded to acute, unawned; paleas about ½ the length of

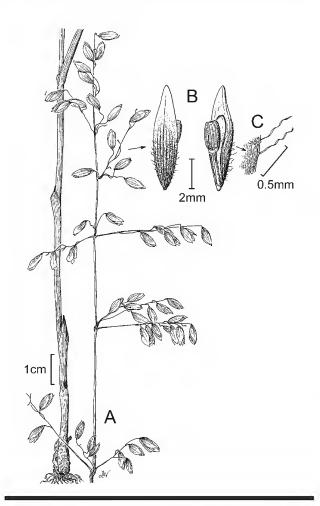

FIGURE 145. Melica montezumae. A. Habit. B. Florets. C. Flat, twisted hairs. Drawn by Linda Ann Vorobik; copyright Utah State University.

the lemmas; anthers 1–2.5 mm long; rudiments 1.8–5 mm long, acute to acuminate, resembling the bisexual florets. 2n = 18.

DISTRIBUTION AND HABITAT. *Melica porteri* grows on rocky slopes and in open woods, often near streams. It grows from Colorado and Arizona to central Texas and northern Mexico.

Specimens Examined. MEXICO. Chihuahua. Chihuahua. Chihuahua, 9 Oct 1888, C.G. Pringle 2045 (US).

Melinis P. Beauv.

Annual or perennial; habit various. Culms erect, decumbent, or prostrate. Sheaths open; ligules of hairs or membranous and ciliate. Inflorescences terminal, simple panicles or panicles of spikelike primary branches, usually with capillary secondary

branches and pedicels; disarticulation below the glumes, sometimes also below the upper florets, the upper florets then falling first. Spikelets with 2 florets; lower glumes present or absent, 0- to 1-veined, unawned; upper glumes equaling or exceeding the florets, sometimes gibbous basally, 5- to 7-veined, emarginate to bilobed, awned or unawned; lower florets staminate or sterile; lower lemmas similar to the upper glumes, but not gibbous; upper florets bisexual, laterally compressed; upper lemmas subcoriaceous, glabrous, smooth, unawned; upper paleas resembling the upper lemmas; lodicules 2, fleshy or membranous. x = 9.

Melinis is an African and western Asian genus of 22 species that grow in savannahs, open grasslands, and disturbed places.

200. *Melinis repens** (Willd.) Zizka, Biblioth. Bot. 138: 55. 1988. *Saccharum repens* Willd., Sp. Pl. 1: 322. 1797. *Rhynchely-*

trum repens (Willd.) C. E. Hubb., Bull. Misc. Inform. Kew 1934(3): 110.1934.

FIGURE 147

Annual or short-lived perennial. Culms (20)40-150 cm long, decumbent, usually rooting at the lower nodes; nodes pubescent; internodes glabrous or with papillose-based hairs, hairs to 4.7 mm long. Sheaths glabrous or with papillose-based hairs, hairs 0.5-4.7 mm; ligules 0.7-2.2 mm long, of hairs; blades 3.6-27 cm long, 2-9(14) mm wide, flat, glabrous or pubescent, with or without papillose-based hairs. Panicles (4)6-22 cm long, (1.5)2.5-12 cm wide; primary branches to 11 cm long, ends of the primary branches, secondary branches, and pedicels capillary; pedicels 0.6-5.3 mm long, usually hairy distally, hairs to 6.3 mm. Spikelets 2-5.7 mm; callus hairs to 4 mm long; lower glumes 0-1.7 mm long, pubescent, sometimes with papillosebased hairs, apex rounded, truncate, or slightly cleft; upper glumes (1.9)2.3-4.9 mm long, enclosing the upper florets, gibbous basally, densely pubescent, the hairs to 7 mm long, sometimes papillose-based, varying from white to rose or darkish purple, apex tapering, beaked, glabrous, unawned or awned, awns to 4.1 mm; lower florets staminate or sterile; lower lemmas 1.9-4.8 mm long, unawned or with awns to 4.2 mm; lower paleas 0.9-4 mm long; anthers (0.8)1.5-2.6 mm long, orangebrown to orange; upper lemmas 1.8-2.7 mm long, glabrous; anthers 3, 1.2-1.7 mm long, orange-brown to orange. Caryopsis 1.3–1.9 mm long, 0.6–0.9 mm wide. 2n = 36.

DISTRIBUTION AND HABITAT. *Melinis repens* is native to Africa and western Asia. It is now established throughout the subtropics, including the southern portion of North America and northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: terracería [dirt road] Batopilas-La Bufa, 1.4 km del entronque [junction] Mesa de la Yerbabuena, 14 Feb 2003, R.Bye & col. 31361 (US); Parque Nacional Barranca del Cobre, 3.2 km S of La Bufa on road to Batopilas, tropical forest, 1050 m, P.M. Peterson, Annable & Valdés-Reyna 10859 (US). Madera: Mesa del Yerbanís, ejido El Largo, 12 Oct 1990, bosque [forest] de Quercus, 1900 m, O. Bravo 1854 (CIIDIR, MEXU); Ciénega Ojo de la Vibora, ejido El Largo, 14 Aug 1990, bosque de encino [oak], 1800 m, A. Benítez 1919 (CIIDIR, MEXU). Matamoros: 19.3 km S of Villa Matamoros on hwy 45 to Durango, 27 Sep 1988, grassland, 1800 m, P.M. Peterson & Annable 5979 (ENCB, US). Ocampo: Ca 1 km W of W boundary of Parque Nacional "Cascada de Basaseachic," 13 km from the Cahuisori-Ocampo road on the road to Candamena, 2.25 km below Cruz, 23 Sep 1994, 1570 m, Spellenberg, Corral & Estrada 12145 (NMC). Temosachi: Nabogame, 5 Aug 1988, 1800 m, Laferr. 1623 (NMC).

Microchloa R. Br.

Perennial (rarely annual); erect and caespitose, or decumbent and mat-forming. Culms 5–60 cm; nodes glabrous. Leaves mostly basal; ligules membranous and ciliate or of hairs; blades

often stiff, convolute. Inflorescences terminal, panicles with a solitary (rarely 2), slender, spikelike branch; rachises curved or falcate, semicircular or crescentic in cross section. Spikelets solitary, with 1(2) floret, terete to dorsally compressed; florets bisexual; disarticulation above the glumes; glumes subequal, exceeding the florets, 1-veined; lower glumes asymmetric, keeled, keels somewhat twisted; upper glumes symmetric, flat, midveins straight; lemmas membranous or hyaline, 3-veined, veins hairy; paleas with 2 pubescent keels. Caryopsis $0.9{\text -}1.5$ mm long, glabrous. x = 10, 12.

Microchloa includes six species that occur throughout the tropics (Cope 1999; Peterson et al., 2015). Most species grow in open mesic to xeric habitats, often in shallow, hard soils.

201. Microchloa kunthii Desv., Mém. Soc. Agric. Angers 1: 179.

Perennial; forming small, dense tufts. Culms 5–30 cm long. Sheaths generally shorter than the internodes; ligules 1–1.5 mm long, ciliate; blades 1–1.5 mm wide, flat or folded, with thick, scabrous, white margins; cauline blades 1–2.5 cm long; innovation blades to 6 cm. Panicle branches 6–15 cm long; rachises ciliate. Spikelets 2.5–3.5 mm long; lemmas 2–2.5 mm long, keels pilose, margins densely pilose, hairs 0.2–1 mm long. 2n = 24, 40.

DISTRIBUTION AND HABITAT. Microchloa kunthii grows on granitic outcrops on rocky slopes. Its range extends southward from the mountains in Arizona and the Big Bend region of Texas through Mexico to Guatemala.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: Ejido de Guazarachic, 9 Aug 1974, pinyon woodlands, 2250 m, M.F. Robert 3216 (ENCB); 56.4 km W of Parral on road to Balleza and 35.5 km S of Balleza on Mex 432, near Corral de Duarte, 18 Sep 1991, pine-oak forest, 2210 m, P.M. Peterson, Annable & Valdés-Reyna 10703 (CIIDIR, US). Batopilas: Arroyo Baqueachi, at 1/2 km E of small villaje [village], 28 Aug 2003, grassland, 2004 m, P.M. Peterson & P. Catalán 17571 (US). Bocoyna: 18.7 mi S of San Juanito on road to Creel, 2200 m, P.M. Peterson & Annable 5862b (US). Chinipas: Sierra Saguarivo, 1.3 mi W of Curahui, 9 Sep 2008, tropical deciduous forest, 1001 m, P.M. Peterson & J.M. Saarela 22152 (US). Chihuahua: Dry gravelly soil, hills and plains near Chihuahua, 6 Aug 1885, C.G. Pringle 425 (ENCB, US); 40 km W of Chihuahua, 20 Aug 1939, 1735 m, L. H. Harvey 1550 (US); km 28 Cd. Chihuahua-Cd. Cuauhtémoc, 27 Oct 1954, Hern.-Xol. & C. San Francisco del Oro: 21 km W of Parral and approx. 3.2 km N on dirt road to Torrencillo, 26 Sep 1988, grassland, 2000 m, P.M. Peterson & Annable 5962 (ENCB, US).

Muhlenbergia Schreb.

Annual or perennial; hermaphrodites or occasionally monoecious; often caespitose, sometimes mat-forming, usually rhizomatous, rarely stoloniferous. Culms 2-300 cm tall, erect, geniculate, or decumbent, usually herbaceous, sometimes becoming woody; internodes solid or hollow. Sheaths open, auricles absent; ligules membranous or hyaline, sometimes firm or coriaceous, acuminate to truncate, sometimes minutely ciliolate, sometimes with lateral lobes longer than the central portion; blades narrow, flat, folded, or involute, sometimes arcuate. Inflorescences terminal, sometimes also axillary, open to contracted or spikelike panicles; disarticulation usually above the glumes, occasionally below the pedicels. Spikelets 1(2-3)-flowered, laterally compressed or terete; glumes subequal in length, mostly shorter than the lemmas, or as long as or exceeding the lemmas, usually (0)1(2 or 3)-veined, apex entire, erose, or toothed, truncate to acuminate, sometimes mucronate or awned; lower glumes sometimes rudimentary or absent, occasionally bifid; upper glumes shorter than to longer than the florets; lemmas membranous or rather firm, glabrous, scabrous, or with short hairs, 3-veined (occasionally appearing 5-veined), callus glabrous or hairy, apex awned, mucronate, or awnless; awns, if present, straight, flexuous, sinuous, or curled, sometimes borne between 2 minute teeth; paleas membranous or rather firm, welldeveloped, about as long as or shorter than the lemma, 2-veined, rounded on the back; lodicules 2, short, fleshy, truncate; lateral margins thin; ovary glabrous, styles free to their bases, stigmas 2; stamens (1 or 2)3, anthers purple, orange, yellow, or olivaceous. Caryopsis elongate, fusiform or ellipsoid, slightly dorsally compressed, usually not falling free from the lemma and palea. Cleistogamous panicles sometimes present in the axils of the lower cauline leaves, enclosed by a tightly rolled, somewhat indurate sheath. Chromosome number x = 8, 9, 10.

Muhlenbergia contains approximately 182 species, most of them native to the Americas; 6 species occur in southeastern Asia (Peterson and Annable 1990, 1991, 1992; Herrera Arriata

1998; Peterson 2003b; Herrera Arrieta and Peterson 2007; Wu and Peterson, 2006; Peterson et al., 2007, 2010; Soreng et al., 2017b).

KEY TO SPECIES OF MUHLENBERGIA

 Spikelets in clusters of 3 to 5 or more; lemmas usually with veins (lateral or central) excurrent into awns. Spikelets subtended by bristles on 1 side, clustered; leaves with prominent auricles
terminal, 2–4 mm long
4. Fertile floret mucronate or with an awn less than 1.5 mm long
1. Spikelets not in clusters of 3, if in clusters then in pairs; lemmas with veins not excurrent into awns.
5. Inflorescence 1-sided raceme-like panicles; branches 1 per node; spikelets in pairs, at the end of branches
5. Inflorescence several-sided panicles or raceme-like, never 1-sided; branches 1 or more per node; spikelets never in pairs.
6. Lemma veins densely silky-pubescent.
7. Annual plants, erect to geniculate; lemma 1.3–1.7(1.9) mm long; pedicels of terminal spikelet on each branch nodding to reflexed
7. Perennial plants, densely tufted, erect; lemma 2.3–3.2(3.8) mm long; pedicels of the terminal spikelet on each
branch straight, flexuous to occasionally nodding to reflexed
6. Lemma veins not densely silky-pubescent.
8. Spikelets usually 2-flowered, the perfect floret sessile and the pedicellate floret staminate to neutral, plumbeous.
9. Annual plants; ligules 1.6–3.2 mm long; palea veins usually extended into awns
9. Perennial plants; ligules 6–10 mm long; palea veins not extended into awns
8. Spikelets 1-flowered, with variable colors and textures.
10. Annual plants.
11. Glumes and lemmas awnless, the lemma sometimes mucronate.
12. Lemmas 2.6-3.2 mm long, with prominent veins, somewhat dorsally compressed, oblong-ellipsoid;
culms 30–80 cm tall, stout
12. Lemmas up to 2.5 mm long, with inconspicuous veins, rounded, narrowly lanceolate to elliptic-oblong;
culms up to 40 cm tall, slender.
13. Glumes longer than the lemma, acuminate.
14. Lemma appressed-pubescent at margins and midvein, 1.4-1.7 mm long, apex acute; pedicels
erect; palea appressed-pubescent on the proximal ¾, 1.4–1.7 mm long; glumes 1.6–2.1 mm
long; auricles absent M. annua
14. Lemma glabrous, 1-1.2 mm long, apex rounded or obtuse; pedicels nodding or reflexed,
at least in the terminal spikelet of each branch; palea glabrous, 1-1.2 mm long; glumes
1.2–1.5 mm long; auricles present
13. Glumes shorter than the lemma, obtuse to acuminate.
15. Glumes pubescent at least at the apex, short-pilose to villous.
16. Pedicels nodding or reflexed, at least in the terminal spikelet of each branch; anthers
olivaceous, 0.6–1.2 mm long
16. Pedicels ascending, at least in the terminal spikelet of each branch; anthers purple, up to 0.7 mm long.
17. Lemma 0.8–1.5 mm long, obtuse to subacute, awnless M. minutissima
17. Lemma 1.3-2 mm long, acuminate, mucronate to short-awned, the mucro or awn
0.1–1(2) mm long
15. Glumes glabrous or minutely scabrous close to the apex. 18. Panicle branches capillary, spreading, open to reflexed; inflorescence 3.5–11 cm wide;

blade margins and midveins prominent, whitish and thickened.

 19. Pedicels nodding or reflexed, at least in the terminal spikelet of each branch; lemma 1.3–1.8 mm long, glabrous; anthers 0.6–1.3 mm long
21. Panicle long-exserted; branches 9–12 mm long, closely appressed at maturity; blades mostly basal, numerous
22. Lemmas deeply bilobed, the lobe apex rounded to obtuse, the lobes 1–1.4 mm long, lateral veins prominent on the lower ½, scarce to densely appressed villous pubescence, the brownish hairs 0.5–0.7 mm long
the teeth less than 1 mm long, lateral veins evident along entire length, pubescence, when present, not as above.
23. Lemma 1.3–2.5 mm long.
24. Upper glumes apex wide and truncate, usually 2- to 3-toothed.
25. Lemma awn sinuous-undulate, crisped and flexuous, olive-green; lemma inflated near the
central part, lanceolate, 1.7–2.2 mm long
25. Lemma awn irregularly flexuous, purplish; lemma narrowly lanceolate, 1.4–4.2 mm long
M. peruviana
24. Upper glumes apex acute, acuminate or subulate, often awned.
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long.
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long;
 24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
 24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half
24. Upper glumes apex acute, acuminate or subulate, often awned. 26. Glumes pubescent near the apex, short-pilose to villous; lemma awn up to 3.5 mm long. 27. Lemma 1.3–2 mm long, lemma awn 0.1–1(2) mm long; caryopsis 0.8–1 mm long; pedicels 2–7 mm long, usually longer than florets; palea 1.3–2 mm long, minutely appressed-pubescent at proximal half

32. Lemma awn 1–3 mm long, lemma somewhat dorsally compressed, oblong-ellipsoid, with prominent veins
33. Glumes elliptical, oblong or lanceolate, up to 2 mm long, excluding the awn;
lower glumes 1-veined, apex bifid; spikelets borne singly.
34. Ligules 0.3–0.9 mm long, lemma 3–4.5(5) mm long, subulate to lanceolate,
not rounded, glabrous to antrorsely scabrous, appearing 5-veined; cleistoga-
mous spikelets usually absent in the axils of proximal branches
34. Ligules 1–3 mm long; lemma 2.5–3.5(4) mm long, narrowly lanceolate,
rounded, scabrous, 3-veined; cleistogamous spikelets usually present in the axils of proximal branches
33. Glumes of superior spikelets of each branch subulate, 2–5 mm long; lower glumes
2-veined, with 2 small awned teeth, awns 0.8–1.3 mm long; spikelets generally
borne in pairs, 1 sessile and 1 pedicellate.
35. Glumes equal or longer than the lemma; lemmas 2.5–4.5 mm long, awn
7–15 mm long in the distal spikelet of each branch
10–20 mm long in the distal spikelet of each branch M. brevis
31. Panicle open with spreading branches, more than 2 cm wide at maturity.
36. Lemma awn 1-3 mm long; lemma somewhat dorsally compressed, oblong-ellipsoid
with prominent veins.
37. Lemma 2.2–3 mm long; panicle branches broadly ascending, sparsely flowered,
naked toward base
37. Lemma 3-4.2 mm long; panicle branches narrowly ascending, appressed, flow-
ered from the base
36. Lemma awn 5–30 mm long, lemma generally rounded.
38. Glumes obtuse to acute, 0.2–0.7 mm long. 39. Glumes dimorphic, those from proximal spikelets of each branch often awn-
less, those of distal spikelets often 1 or both awned; ligules up to 0.8 mm
long; inflorescence appearing secund or placed on 1 side of main axes
39. Glumes similar in all spikelets, awnless; ligules 1–2.5(3) mm long; inflores-
cence not secund.
40. Inflorescence diffuse at maturity; pedicels capillary, thin and flexuous,
glabrous; cleistogamous spikelets absent; lemmas scabrous on and among
veins
40. Inflorescence not diffuse; pedicels short and thick, antrorsely scabrous;
cleistogamous spikelets usually present at the axils of inferior branches;
lemmas scabrous, with short hairs, appressed on veins close to the base
M. microsperma
20 Classic months are set on assessed 0.9. 2/2) may long
38. Glumes mostly acute or awned, 0.8–2(3) mm long.
41. Glumes dimorphic, those from proximal spikelets of each branch often awn-
41. Glumes dimorphic, those from proximal spikelets of each branch often awnless, 0.2–0.7 mm long, those from distal spikelets often 1 or both awned;
41. Glumes dimorphic, those from proximal spikelets of each branch often awnless, 0.2–0.7 mm long, those from distal spikelets often 1 or both awned; inflorescence appearing secund or inserted on 1 side of the main axes
41. Glumes dimorphic, those from proximal spikelets of each branch often awnless, 0.2–0.7 mm long, those from distal spikelets often 1 or both awned; inflorescence appearing secund or inserted on 1 side of the main axes
41. Glumes dimorphic, those from proximal spikelets of each branch often awnless, 0.2–0.7 mm long, those from distal spikelets often 1 or both awned; inflorescence appearing secund or inserted on 1 side of the main axes
41. Glumes dimorphic, those from proximal spikelets of each branch often awnless, 0.2–0.7 mm long, those from distal spikelets often 1 or both awned; inflorescence appearing secund or inserted on 1 side of the main axes
41. Glumes dimorphic, those from proximal spikelets of each branch often awnless, 0.2–0.7 mm long, those from distal spikelets often 1 or both awned; inflorescence appearing secund or inserted on 1 side of the main axes
41. Glumes dimorphic, those from proximal spikelets of each branch often awnless, 0.2–0.7 mm long, those from distal spikelets often 1 or both awned; inflorescence appearing secund or inserted on 1 side of the main axes

^{10.} Perennial plants.

^{43.} Plants rhizomatous, rhizomes often stout, scaly, and creeping.

43.

44. Blades articulated at base and early deciduous, culms much branched and lignified, bamboo-like, covered by cylindrical sheaths, the apex truncate; culms 100–300 cm tall; rhizomes 2–5 mm thick
44. Blades not articulated, persistent, occasionally constricted at the base but without a lineal abscission, if belatedly deciduous, then the sheaths apex breaking irregularly; culms usually less than 100 cm tall, if occasionally bamboo-like, then the culms at base (or stolons) 1–2 mm thick and rooting at the nodes. 45. Lemmas awned, the awns (1)3–20(25) mm long; rhizomes short, inconspicuous. 46. Lemma awns 0.1–3(5) mm long, straight; panicle 1–3 mm wide; sheaths longer than the internodes
45. Lemmas unawned or mucronate, the mucros 0.1–0.8 mm long; rhizomes elongate and conspicu-
ous.
47. Panicles narrow to open, 4–16 cm wide.
48. Ligules 1–3 mm long.
49. Culms nodulose-rugose; lemma 2–3 mm long, almost cylindrical
49. Culms smooth, lemma 2–2.5 mm long, never cylindrical
50. Ligules 0.5–2 mm long, hyaline, with well-developed lateral lobes or auricles; blade margins
and midveins prominent, whitish, thickened
50. Ligules 0.2–1 mm long, ciliate, without lateral lobes or auricles; blade margins and midveins
not conspicuously thickened, greenish
47. Panicles contracted, narrow, 0.1–3.9 cm wide.
51. Spikelets 1.4–2.5 mm long.
52. Lemmas and paleas densely villous, the hairs 0.4–1 mm long; sheaths 5–15 cm long;
panicles usually on an exserted peduncle; ligules apex acute M. villiflora
52. Lemmas and paleas glabrous or with minute appressed pubescence, the hairs about 0.1 mm long; sheaths 0.3–2.4 cm long; panicles partially included in the
upper sheaths; ligules apex obtuse or truncate.
53. Panicle 1–5 cm long, 0.1–0.4 cm wide; lemma awnless, minutely pubescent along margins and at base, the lemma green or purplish <i>M. utilis</i>
53. Panicle 0.5–3 cm long, 0.3–0.7 cm wide; lemma mucronate, the mucro about
0.2 mm long, sparsely short-pubescent over the proximal ½, with conspicuous dark olivaceous spots
51. Spikelets 2.4–8 mm long.
54. Lemmas with tawny hairs up to 0.6 mm long on the lower ½ along the midveins
and margins; leaf blades 4–12 cm long, not arcuate; anthers 1.8–2.4 mm long, orange
54. Lemmas glabrous or with minute appressed pubescence along margins and the
base, the hairs less than 0.1 mm long; leaf blades 0.4–6 cm long, somewhat arcu-
ate spreading; anthers 0.7–1.4 mm long, yellow to purplish M. repens
Plants caespitose, rhizomes absent.
55. Upper glumes 3-veined; old sheaths flattened below and sometimes spirally twisted near base.
56. Upper glumes apex 3-toothed and 3-awned, the teeth usually awned (including the awns) 1/3 to 1/2
the length of the glumes, and the awns up to 1.7 mm long
56. Upper glumes apex entire or 2- to 4-toothed, the teeth small and unawned, less than 1/8 the length
of the glumes.
57. Panicles 2–5 cm long; ligules 0.2–0.5 mm long, apex truncate; culms 20–30 cm tall M. flaviseta
57. Panicles 5–25 cm long; ligules 2–20 mm long, apex acuminate; culms 10–80(100) cm tall.
58. Sheath becoming flat, ribbonlike or papery and conspicuously spirally twisted near base;
upper glumes apex entire and acute; spikelets light grayish-green to white; ligules (6)10–20 mm long, hyaline, not brownish below

58. Sheaths flat below but usually not spirally twisted near base; upper glumes apex often with 3 or 4 small teeth and truncate; spikelets plumbeous; ligules 2–8 mm long, membranous to hyaline and often brownish below
59. Culms (65)80–230(300) cm tall; leaf blades 20–100 cm long, 2–7 mm wide, flat or folded.
 60. Lemmas unawned, mucronate (mucros less than 1 mm long), or awned, with awns 1–4 mm long. 61. Panicle 35–100 cm long, (8)15–30 cm wide, purple or brown,; branches 6–25 cm long, naked at base; spikelets 1.3–2.6 mm long
1
63. Lemmas awnless or the awn up to 4 mm long; basal sheaths strongly compressed-keeled
62. Ligules 2–15 mm long, lemma pilose over the proximal half or entire surface. 64. Plants sparsely to densely pilose on culms, leaves, and spikelets; lemma (2)2.4– 2.6(3) mm long
65. Leaf sheath auricles absent; ligules 10–25 mm long; lemmas pubescent along the midvein and margins on lower ½–¾
M. robusta
60. Lemmas awned, with awns 5–30(40) mm long. 66. Sheath auricles present, long and pointed, 10–20 mm long, lemma awn 10–15 mm long
66. Sheath auricles absent or rudimentary, rarely more than 2 mm long.67. Spikelets 1.2–2.2 mm long, generally reddish to purple; glumes as long as or shorter than lemma.
68. Branches and leaves woolly pubescent; glumes the same length as the lemma, apex obtuse, awnless
 59. Culms 10–70 cm tall; leaf blades 1–16 cm long, 0.3–2.5 mm wide, filiform, involute, flat or folded. 69. Panicles broad, open, loosely contracted to diffuse, (2)3–20 cm wide; panicle branches usually widely spreading to loosely ascending. 70. Lemmas unawned; spikelet pedicels flexuous nodding or reflexed; lemmas with a thick covering of tawny to shiny silky hairs located on the midvein and margins; paleas densely
villous between the veins
70. Lemmas with awns 0.5-40 mm long; spikelet pedicels erect, not flexuous nodding or re-
flexed; lemmas without a thick covering of tawny to shiny silky hairs on the midvein and
margins but with appressed pubescence, the hairs scattered; paleas sparsely pubescent between the veins.
71. Plants decumbent or geniculate, generally short, culms 15–60(80) cm tall, leaf blades 2–10 cm long (occasionally up to 16 cm long in <i>M. arenicola</i> and <i>M. argentea</i>). 72. Plants conspicuously branched, especially from the middle and lower nodes, longely coessitoger culms decumbent, geniculate, or erect

loosely caespitose; culms decumbent, geniculate, or erect.

73. Plants distinctly bushy in appearance; perennial with a wiry and knotty base; panicles 6-15 cm wide; anthers 1.5-2.3 mm long; caryopsis ellipsoid, com-73. Plants not distinctly bushy in appearance; plants short-lived perennials to annuals with delicate bases; panicles 1–6.5 cm wide; anthers 0.9–1.5 mm long; 72. Plants not conspicuously branched, caespitose; culms erect to rarely slightly decumbent near the base. 74. Spikelets silvery-olive to reddish; panicles 0.7-3.5 cm wide; lemma awns 5–10 mm long; anthers 1–1.6 mm long, green-yellowish M. argentea 74. Spikelets never silvery-olive to reddish, mostly green; panicles 3–20 cm wide; lemma mucronate or awned 0.5–4 mm long; anthers 1.2–2.1 mm long, greenish or purplish. 75. Plant base not rhizomatous; leaf blades 4-7 cm long, with margins and 75. Plant base rhizomatous, the rhizomes short, leaf blades 5–10(16) cm long, margins and midvein not prominent, not cartilaginous, green. 76. Leaf blades not arcuate, 1-2.2 mm wide, 4-10(16) cm long; 1 or more culm nodes exposed; leaf blades reaching 1/4-1/2 of the plant height 76. Leaf blades arcuate, 0.3–0.9 mm wide, 1–3(5) cm long; usually lacking exposed culm nodes; most leaf blades reaching less than 1/5 of the plant height M. torreyi 71. Plants erect, of medium height, culms (25)50–120 cm tall, leaf blades 10–50 cm long. 77. Panicle elongated, loosely contracted, generally longer than wide. 78. Lemma hyaline, densely villous, widely ovate-lanceolate, apex bifid, teeth 1 mm long, subacute, midvein prominent, reddish, continuous with an geniculate awn 10-12 mm long that is twisted near base M. lucida 78. Lemma glabrous, not transparent, narrowly lanceolate, apex entire, midvein not prominent or reddish, awn flexuous, not twisted at the base. 79. Spikelets silvery-olive to reddish, 3–3.5 mm long; lemma awn 5–10 mm 79. Spikelets never silvery-olive to reddish, 4.5-5 mm; lemma mucro or awn different in size; anthers 1.4–2.6 mm long. 80. Panicle 8-20(25) cm long; pedicels 3-20 mm long, capillary; lemma 80. Panicle 15-50 cm long; pedicels 1-3 mm long, not capillary; lemma awn 10-40 mm long M. elongata 77. Panicles almost as long as wide, open, loosely to densely flowered. 81. Spikelets 3.5–5.1 mm long; lemmas 3.5–5.1 mm long; paleas 3.5–5.1 mm long. 82. Lemmas scaberulous to scabrous, not smooth and shining, purple; leaf blades 1-3 mm wide, flat or involute, not falcate; culms usually with a single node; anthers purplish. 83. Lemma awned, awn 10-22 mm long; glumes 1-1.7(2) mm long, apex 83. Lemma mucronate or shortly awned, awn or mucros 0.5-1(2) mm long; acute M. mucronata 82. Lemmas glabrous, smooth and shining, stramineous; leaf blades 1–2.5 mm wide, tightly involute to falcate; culms usually with 2-4 nodes; anthers greenish M. setifolia 81. Spikelets (2)2.4-3.6 mm long; lemmas 2.3-3.6 mm long; paleas (2)2.4-69. Panicles narrow, contracted to loosely contracted, 0.2–3 cm wide; panicle branches usually closely appressed to loosely spreading.

84. Panicles spikelike, 0.2–1.2 cm wide, densely flowered, sometimes interrupted near the base; primary branches tightly appressed, the branches 0.1–4 cm long. 85. Culms (35)50–200 cm tall; panicles 15–60 cm long; sheaths rounded near the base.
86. Glumes 3.4–5.6 mm long, usually longer than the lemma, apex unawned and not mucronate; ligules (5)8–40(50) mm long; anthers 1.5–2.2, dark greenish
86. Glumes 1.8–3.2 mm long, shorter than the lemma, apex sometimes mucronate
or short-awned, the awn up to 1.7 mm long; ligules 0.5–2(3) mm long; anthers 1.3–1.8 mm long, yellow to purple
85. Culms 15–60 cm tall; panicles (2)4–16 cm long; sheaths compressed-keeled near the
base.
87. Lower glumes all 1-veined, unawned or mucronate, the mucros 0.5–1 mm long; branches with a single spikelet, or if in pairs, the upper and lower spikelets both perfect
87. Lower glumes 2- or 3-veined and awned, the awns 1–5 mm long; branched with
paired spikelets, the lower spikelet staminate or sterile and the upper spikelet perfect.
88. Upper leaf blades acuminate with slender awnlike seta 3-8(10) mm long; lig-
ules (2)3–12 mm long; culms erect
ules 0.5–3 mm long; culms erect to decumbent.
89. Ligules 0.5–1 mm long, truncate; blades generally short with navicular
apex, obtuse to subacute
89. Ligules 2–3 mm long, acuminate and erose, usually auriculate with triangular lateral lobes 0.5–2.5 mm long; blades apex acute to mucronate,
sometimes extending up to 3 mm as a slender seta M. phleoides
84. Panicles narrow, (0.6)1–3 cm wide, loosely contracted to narrowly open; primary branches
loosely appressed to spreading up to 70° from the rachises, the branches 0.4–8.5 cm long.
90. Lemmas unawned, mucronate (mucros less than 1 mm long), or awned, the awns
1–6 mm long.
91. Spikelet pedicels flexuous nodding to reflexed, capillary; lemmas with a thick
covering of tawny to shiny silky hairs located on the midvein and margins;
ligules(0.3)0.7–2(2.7) mm long, hyaline to opaque throughout M. tricholepis
91. Spikelet pedicels erect, not flexuous nodding to reflexed or capillary; lemmas
without a thick covering of tawny to shiny silky hairs on the midvein and mar-
gins, usually glabrous, puberulent throughout, or densely villous only on the mar-
gins below; ligules 4-35 mm long, firm below and often brownish.
92. Spikelets 3.8–5 mm long; basal sheaths terete; anthers 1.5–2.2 mm long,
greenish; ligules not decurrent and brownish below.
93. Glumes 1.8–2.5 mm long, apex obtuse, veins inconspicuous, less than ½ the length of the spikelet; lemma awn 0.5–6 mm long <i>M. dubia</i>
93. Glumes 2.5–3 mm long, apex acuminate to mucronate, ½ or more the
length of the spikelet, lemma awn 5–10 mm long
92. Spikelets 2.4–3.5 mm long; basal sheaths compressed-keeled or flat; anthers
1.1–1.6 mm long, yellowish or purplish; ligules deccurent, brownish below.
94. Glumes longer than the florets, glabrous and without hairs, scabrous or
smooth; lemmas glabrous, scabrous or smooth, rarely puberulent; ligules
10–35 mm long
94. Glumes shorter than the florets, pubescent especially near the base; lem-
mas villous on the lower ½ and margins below; ligules 5-13 mm long
90. Lemmas awned, the awns 8–40 mm long (5–10 mm in <i>M. argentea</i>).
95. Leaf blades 20–50 cm long, mostly involute.
96. Ligules 2–8 mm long, firm below, membranous at the apex, obtuse to acute; panicle green or tawny
painere green or tarring

95.

96. Ligules 1–3 mm long, firm, truncate, membranous, minutely ciliolate; pani-
cles with purple spots
Leaf blades 2–20 cm long, flat to involute.
97. Panicles loosely spreading, ovoid or pyramidal, 6–20 cm long, branches spreading; anthers 0.9–1.6 mm long.
98. Spikelets silvery-olive to reddish
98. Spikelets never silvery-olive to reddish.
99. Plants decumbent, wiry, delicate; lemma awn 10–30 mm long; glumes
½-¾ as long as the lemma M. tenuifolia
99. Plants erect, never decumbent, nor wiry, nor delicate; lemma awn
(5)10–20 mm long; glumes less than ½ as long as the lemma
M. alamosae
97. Panicles narrow, spiciform, 2–15 cm long, branches appressed or ascending;
anthers 1.5–3 mm long.
100. Lemma and palea generally glabrous; ligules with lateral lobes 1.5-3
mm long M. pauciflora
100. Lemma appressed-pubescent on the central vein and margins, paleas
appressed-pubescent between the veins; ligules without lateral lobes.
101. Glumes 0.3–1.1 mm long, less than ½ as long as the lemma, apex
obtuse to acute
101. Glumes (1)1.2–2.8 mm long, more than $\frac{1}{2}$ as long as the lemma (at
least the upper glumes), apex acute to acuminate.
102. Anthers 1.5–2 mm long, orange; lemmas elliptic, widest near the
middle; culms strigulose below the nodes M. polycaulis
102. Anthers 0.9–1.5 mm long, yellowish; lemmas lanceolate, wid-
est near the base; culms scaberulous below the nodes
M. tenuifolia

202. *Muhlenbergia alamosae* Vasey, Bot. Gaz. 16(5): 146–147. 1891.

Perennial plant; erect. Culms 30–70 cm tall, glabrous. Sheaths 3.5–6.5 cm long, rounded; ligules 1–4 mm long, membranous, hyaline; blades 5–15 cm long, 1–3 mm wide, flat. Panicles 6–12 cm long, 2.5–3.5 cm wide, partially included in the superior sheath, ovoid, spreading with ascending ramifications, twigs 3.5–5 cm long, lateral pedicels shorter than spikelets. Spikelets 2–3.2 mm long, hyaline with prominent veins, green to purple; glumes 1–2 mm long, glabrous, 1-veined, veins green to purple, ovate-lanceolate, mucronate, lower glumes 1–1.5 mm long, the mucro 0.5 mm long; upper glumes 1.5–2 mm long, the mucro 0.5–1 mm long; lemma 2–3.2 mm long, subulate, pilose only at the base, scabrous at the apex, 3-veined, veins green, lemma awn (5)10–20 mm long; palea equal to lemma; anthers 1–1.2 mm long, yellow. Caryopsis 1–1.2 mm long, 0.3–0.4 mm wide, fusiform.

DISTRIBUTION AND HABITAT. Muhlenbergia alamosae grows in grasslands and pine–oak forests at elevations of 1,150–2,450 m. It occurs in Mexico in Aguascalientes, Baja California Sur, Chihuahua, Durango, Guanajuato, Jalisco, México, Morelos, Puebla, Sinaloa, and Sonora.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Rancho Byarly, Sierra Charuco, 17–25 Apr 1948, 1700 m, *Gentry* 8089 (MEXU, US). Guachochi: 20.3 km NE of La Bufa and 3.2 km S of Basigochi, 2180 m, *P.M. Peterson*

& Annable 10807 (US); Parque Nacional Barranca del Cobre, 13.6 mi NE of La Bufa on road towards Samachique, 2240 m, P.M. Peterson, M.B. Knowles, C.H. Dietrich & S.M. Braxton 13573 (US). Madera: Puerto de El Tenedor, ejido El Long, 2450 m, O. Bravo 1929 (CHAPA, CIIDIR). Ocampo: overlook of Cascada de Basaseachic, approx. 37 mi W of Tomochic, 22 Sep 1986, 2200 m, P.M. Peterson & Annable 4548 (US); Parque Nacional Cascada de Basaseachic, 1620 m, Spellenberg, Soreng, R. Corral & T. Lebegue 8038 (CIIDIR); 5.25 km NW of Pinos Altos on road to Las Baterías, at the crossing of río Haciendita, 1700 m, Spellenberg & P.S. Martin s.n. (MEXU). Temósachi: Nabogame, 2200 m, Laferr. 1396 (MEXU).

Lycurus setosus (Nutt.) C. Reeder.

FIGURE 148

Caespitose perennial. Culms 30–60 cm tall, erect, scabrous to puberulent just above or below the nodes. Sheaths usually 1–5 cm long, glabrous to pubescent, compressed-keeled near base; ligules (2)3–12 mm long, acuminate to erose, sometimes with lateral lobes the same length as the ligule, the lateral lobes decurrent below; blades 4–10(2) cm long, 1–2.5 mm wide, flat or folded, glabrous to puberulent below and puberulent to hirsute above, margins and midvein whitish-thickened, apex acuminate

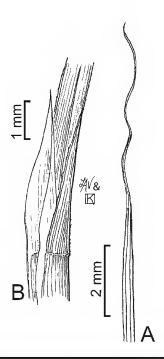

FIGURE 148. *Muhlenbergia alopecuroides*. A. Leaf blade apex. B. Ligule. Drawn by Linda Ann Vorobik and Karen Klitz; copyright Utah State University.

with slender awnlike seta, 3-8(10) mm on the upper blades. Panicles (2)4–10 cm long, 4–8 mm wide, contracted, narrow, densely flowered, and spikelike; primary branches 0.1–0.3 cm long, tightly appressed. Spikelets 3–4 mm long, 1–flowered; glumes 1–2 mm long, scaberulous near apex, awned, the awns 1–5 mm; lower glumes usually 2(3)-veined; upper glumes 1-veined, awns 2–5 mm; lemmas 3–4 mm long, puberulent along the margins, awned, the awns 1–3 mm; paleas 3–4 mm long, puberulent between the veins; anthers 1.5–2 mm long, yellow. Caryopsis 1.8–2.2 mm long, brownish. 2n = 40.

DISTRIBUTION AND HABITAT. Muhlenbergia alopecuroides grows in wooded canyons, rocky slopes, desert grasslands, and rock outcrops with Pinus spp., Quercus spp., Cupressus spp., Abies spp., Cornus stolonifera, Ceanothus spp., and Yucca spp. It occurs in northwestern Mexico in Baja California, Chihuahua, Durango, and Sonora, extends into the southwestern United States, and is disjunct in northwestern Argentina and Bolivia; 1,400–2,500 m.

204. Muhlenbergia annua (Vasey) Swallen, Contr. U.S. Natl. Herb. 29(4): 204. 1947.

Annual; small plants. Culms 8-20 cm tall, erect, internodes short, 3-25 mm long, glabrous, scabrous below nodes. Sheaths 2-25 mm long, glabrous to scabrous, margins hyaline; ligules 1.6-2.5 mm long, hyaline, apex irregularly toothed to lacerate, acute, margins entire; blades 1-6 cm long, 0.8-1.5 mm wide, flat to involute, midvein evident, short-pubescent adaxially, scaberulous abaxially. Panicle 5-13 cm long, 1.4-6 cm wide; branches 10-36 mm long, 1 or 2 per node, slender, scattered florets, ascending or extended; pedicels 3–8 mm long, slender, erect, nodes 9-22 per inflorescence. Spikelets 1.4-2.2 mm long, with antocian spots when immature; glumes 1.5-2.1 mm long, equal in length and larger than lemma, glabrous, often with a central vein, prominent, apex acuminate to short-awned, awn not longer that 0.3 mm long; lemma 1.4-1.7 mm long, oblong-elliptic, densely appressed-pubescent on the midvein and margins; palea 1.1–1.7 mm long, oblong-elliptic, densely appressed-pubescent on the lower 34, apex acute; anthers 0.5–0.6 mm long, purplish. Caryopsis 0.9-1.1 mm long, fusiform to ellipsoid, brownishgray. n = 10.

DISTRIBUTION AND HABITAT. Muhlenbergia annua grows on gravelly soils in pine-oak forests at elevations of 2,000–2,270 m. It is uncommon in Mexico, known from the Sierra Madre Occidental in Chihuahua, Durango, and Sonora.

205. *Muhlenbergia arenacea* (Buckley) Hitchc., Proc. Biol. Soc. Washington 41: 161. 1928.

FIGURE 149C-G

Rhizomatous perennial. Culms 10-30(40) cm tall, decumbent, terete to somewhat compressed-keeled near the base; internodes scaberulous below the nodes. Sheaths about ½ as long as the internodes, margins hyaline; ligules 0.5-2 mm long, hyaline, with lateral lobes or auricles 1-2 mm; blades 0.7-4(6) cm long, 0.5-1.7 mm wide, flat, occasionally folded, tapering, scabrous abaxially, strigulose adaxially, margins and midveins thickened, whitish, apex narrow, often sharp, erose. Panicles 5-15 cm long, 4–14 cm wide, broadly ovoid, open; primary branches 2–8 cm long, capillary, straight to slightly flexuous, diverging 45°-80(100)° from the rachises, never appearing involucred, naked proximally; pedicels 1-11 mm long, usually longer than the spikelets. Spikelets 1.5–2.5 mm long, occasionally with 2 florets; glumes 0.9-2 mm long, equal, 1-veined, usually acute to acuminate, occasionally erose and mucronate, mucros to 0.2 mm; lemmas 1.5-2.5 mm long, lanceolate to oblong-elliptic, plumbeous to purplish, sparsely appressed-pubescent on the lower ½ of the margins and midveins, hairs to 0.3 mm long, apex acute to obtuse, sometimes shallowly bilobed, mucronate, mucros to 0.3 mm; paleas 1.5–2.6 mm long, lanceolate, glabrous, obtuse to acute; anthers 1-1.5 mm long, yellowish to purplish. Caryopsis 1–1.3 mm long, elliptic, brownish.

DISTRIBUTION AND HABITAT. Muhlenbergia arenacea grows on sandy flats, plains, alluvial fans, washes, depressions, and alkaline mesas in open grasslands at elevations of 1,000–2,200 m. It ranges from the southwestern United States to

206. Muhlenbergia arenicola Buckley, Proc. Acad. Nat. Sci. Philadelphia 14: 91. 1862.

FIGURE 150

Caespitose perennial. Culms (15)20–60(70) cm tall, somewhat decumbent, 1 or more nodes exposed; internodes hirsute below the nodes. Leaves somewhat basally concentrated, most blades not reaching more than ¼–½ of the plant height; sheaths usually a little shorter than the internodes, not keeled, scaberulous, margins hyaline, basal sheaths rounded, not becoming spirally coiled when old; ligules 2–9 mm long, hyaline, acute, lacerate, often with lateral lobes; blades 4–10(16) cm long, 1–2.2 mm wide, not arcuate, flat, folded, or involute, scabrous, often glaucous, midveins and margins not thickened, green. Panicles 12–30 cm long,

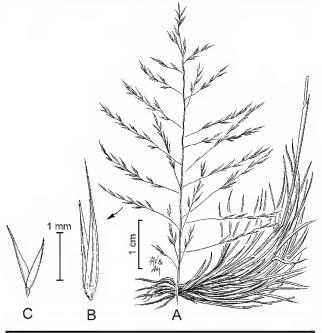

FIGURE 150. *Muhlenbergia arenicola*. A. Habit. B. Floret. C. Glumes. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

5-20 cm wide, diffuse; primary branches 1-10 cm long, diverging $30^{\circ}-80^{\circ}$ from the rachises, naked basally; pedicels 1-4(6) mm long, erect. Spikelets 2.5-4.2 mm long; glumes 1.4-2.5 mm long, equal, 1-veined, apex scaberulous, acute to acuminate, minutely erose, sometimes mucronate, the mucros to 1 mm long; lemmas 2.5-4.2 mm long, narrowly elliptic, usually purplish, scabrous distally, appressed-pubescent on the lower $\frac{1}{2}$ of the margins and midveins, apex acuminate, awned, awns 0.5-4 mm long; paleas 2.5-3.5 mm long, narrowly elliptic, intercostal region sparsely pubescent, apex acuminate, with 2 short mucros 0.1-0.2 mm long; anthers 1.5-2.1 mm long, greenish. Caryopsis 1.9-2.3 mm long, fusiform, brownish. 2n = 80, 82.

DISTRIBUTION AND HABITAT. Muhlenbergia arenicola grows on sandy mesas, limestone benches, and in open desert grasslands, associated with Bouteloua gracilis, B. uniflora, and Larrea tridentata, at elevations of 600–2,135 m. The range of M. arenicola extends to southwestern United States, and the species is disjunct in northwestern Argentina.

209. Muhlenbergia asperifolia (Nees & Meyen ex Trin.) Parodi, Revista Fac. Agron. Veterin. (Buenos Aires) 6: 117, f.1. 1928.

FIGURE 153

Rhizomatous perennial; occasionally stoloniferous. Culms 10–60(100) cm tall, decumbent-ascending, bases somewhat compressed-keeled; internodes glabrous, shiny below the nodes. Sheaths glabrous, margins hyaline; ligules 0.2–1 mm long, firm, truncate, ciliate, without lateral lobes; blades 2–7(11) cm long, 1–2.8(4) mm wide, flat, occasionally folded, smooth or scaberulous in both surfaces, margins and midveins not conspicuously thickened, greenish, apex acute, not sharp. Panicles 6–21 cm long, 4–16 cm wide, broadly ovoid, open; primary branches

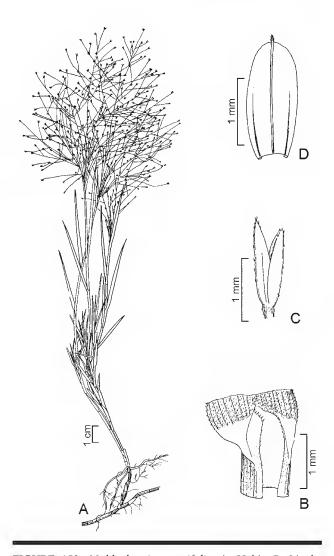

FIGURE 153. *Muhlenbergia asperifolia*. A. Habit. B. Ligule. C. Glumes. D. Lemma. Drawn by Elisabeth P. Roberts for Smithsonian Institution, Department of Botany.

3–12 cm long, capillary, lower branches spreading 30° – 90° from the rachises, never appearing involucred; pedicels 3–14 mm long, longer than the spikelets. Spikelets 1.2–2.1 mm long, occasionally with 2 or 3 florets; glumes 0.6–1.7 mm long, equal, purplish, scaberulous, particularly on the veins, 1-veined, apex acute; lemmas 1.2–2.1 mm long, lanceolate to oblong-elliptic, somewhat plumbeous, glabrous, usually smooth, occasionally scaberulous near the apex, apex acute, awnless or mucronate, mucros to 0.3 mm long; paleas 1.2–2.1 mm long, lanceolate, glabrous, acute; anthers 1–1.3 mm long, greenish-yellow to purplish at maturity. Caryopsis 0.8–1 mm long, fusiform, brownish. 2n = 20, 22, 28.

DISTRIBUTION AND HABITAT. *Muhlenbergia asperifolia* grows in moist, often alkaline meadows, beach margins, and sandy washes, on grassy slopes, and around seeps and hot springs at elevations of 5–3,000 m. This species is common in the western United States and Canada and is also found in Argentina, Bolivia, and Chile. In Mexico *M. asperifolia* occurs in Baja California, Chihuahua, Durango, Jalisco, and San Luis Potosí.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Presa Encinillas, 100 km al N de Chihuahua, 1600 m, *Rzedowski 32378* (MEXU); Base de la Sierra de La Campana, 80 km al N de Chihuahua, 1700 m, *F.W. 210. Muhlenbergia biloba Hitchc., Contr. U.S. Natl. Herb. 17(3): 294. 1913. Bealia mexicana Scribn., True Grasses 103–104, f. 45a. 1890.

Annual; small plants, often caespitose. Culms 9-35 cm tall, very branched at the inferior nodes, scaberulous-pubescent, striate, glabrous to minutely pubescent below nodes, internodes 2-10 mm long, hollow. Sheaths 2-7.5 cm long, keeled, usually striate, scaberulous to almost glabrous, longer than internodes, margin widely scarious; ligules 1.5–3.4 mm long, membranous, apex acute or rounded, irregularly toothed, margins entire, decurrent, ending in auricles, shorter than ligule; blades 1-7 cm long, 0.6-1.4 mm wide, flat, involute when dry, scaberulous abaxially, short-pubescent adaxially, midvein and margins white and hardened on adaxial surface. Panicles 3-10 cm long, 1.5-3.2 cm wide, spreading, branches 1.8-4.5 cm long, sinuoseascending, 1(2) per node; pedicels 1-5.5 mm long, slender, dispersed, ascending, scabrous and minutely glandular, 6-16 nodes per inflorescence. Spikelets 3-4.8 mm long; glumes 3.2-4.8 mm long, 1-veined, equal, green-grayish, obtuse, sparingly pilose to villous, especially over proximal \(\frac{2}{3} \); lemma 2.9-3.5 mm long, sparingly to densely villous over the proximal \(^2\)3, hairs 0.5-0.7 mm long, lateral veins evident in the proximal ½, apex bilobed, the lobes 1–1.4 mm long, rounded obtuse, awn 4–6.5 mm long, emerging between the lobes, scabrous, curly to flexuous; palea 2.6-3.4 mm long, apex obtuse, pubescence similar to the lemma; anthers 1.2–2.3 mm long, purple. Caryopsis 1.5–1.8 mm long, fusiform, brown-olive. n = 8.

DISTRIBUTION AND HABITAT. Muhlenbergia biloba grows on sandy soils derived from calcareous rocks associated with pine forests at elevations of 1,780–2,300 m. It is an endemic species in Mexico found in Chihuahua, Durango, and Sonora.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 15 mi E of El Vergel on road to Parral, 21 Oct 1959, 7500 ft, Correll & Gentry 23270 (ENCB, US). Chihuahua: near Chihuahua, Oct 1886, C.G. Pringle 819 (ARIZ, NMC, US).

211. Muhlenbergia brevis C. O. Goodd., J. Wash. Acad. Sci. 31: 505. 1941.

FIGURE 154

Caespitose annual. Culms 3-20 cm tall, erect, slender, very branched at the base, scabrous to hispidule. Sheaths striate, glabrous or scabrous; ligule 1-3 mm long, thin, lacerate, often auriculate; blades 1-4.5 cm long, 1-2 mm wide, flat or involute, scabrous, with midveins and margins cartilaginous. Panicles 3-12 cm long, 0.5-1.8 cm wide, often included on the base, densely flowered, light green tinted with purple, branches 1-3.8 cm long, plicate-ascending, pedicels 0.2-8 mm. Spikelets 4-5 mm long, slender, in pairs, 1 spikelet sessile and another pedicelled, disarticulating below the pair of spikelets; glumes scabrous, unequal, shorter than lemma; lower glume 2-3.5 mm long, 2-veined, subulate, minutely to deeply bifid, the teeth slender, occasionally short-awned, awn 1.6-1.8 mm long, upper glume 2.4-4 mm long, entire, narrow, acuminate to attenuate, 1-veined, awned, awn to 2 mm; lemma 3.5-5 mm long, narrowly lanceolate, brown-green to purple, scabrous, appressedpubescent between veins to base, apex acuminate, sometimes 2-teethed, awned, the awn 10-20 mm long, rigid to slightly flexuous, scabrous; palea similar to the lemma; anthers 0.5–0.9 mm long, purplish to yellowish. Caryopsis 2-2.8 mm long, narrow, fusiform, brown. 2n=20.

DISTRIBUTION AND HABITAT. *Muhlenbergia brevis* grows on stony hills and gravel plains in grasslands and forests with *Pinus*, *Cupressus*, and *Quercus* at elevations of 1,700–2,400 m. It ranges from the United States to northern Mexico.

Muhlenbergia brevis and M. depauperata share various characters with M. phalaroides, M. phleoides, and M. alopecuroides, for example, spikelets in pairs, lower glumes 2-veined and 2-awned, upper glumes 1-veined and 1-awned, acuminate,

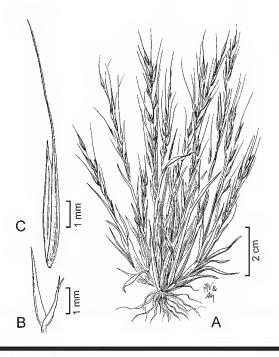

FIGURE 154. Muhlenbergia brevis. A. Habit. B. Glumes. C. Floret. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

lemmas with short-pubescent margins, and pubescent paleas. However, *M. brevis* and *M. depauperata* are sister found in the *Muhlenbergia* subg. *Bealia* (Scribn.) P. M. Peterson clade whereas the other three species are found in the *M.* subg. *Pseudosporobolus* (Parodi) P. M. Peterson clade (Peterson et al., 2010).

212. *Muhlenbergia capillipes* (M. E. Jones) P. M. Peterson & Annable, Syst. Bot. Monogr. 31: 27. 1991. *Sporobolus capillipes* M. E. Jones, Contr. W. Bot. 14: 9. 1912.

FIGURE 155

Caespitose annual; fragile. Culms 15-40 cm tall, reddish, erect, glabrous, minutely scabrous below nodes. Sheaths glabrous to scabrous, margins hyaline; ligules 1.5–2.8 mm long, hyaline, apex toothed to lacerate, acute, occasionally with short auricles, decurrent; blades 3-12 cm long, 0.6-2 mm wide, flat to involute, midvein and margins hardened, short-pubescent to scabrous. Panicle 10–20 cm long, 3.5–8 cm wide; branches 1–5.5 cm long, 1-3 per node, ascending or spreading, pedicels 3-8 mm long, slender, capillary, curved and reflexed. Spikelets 1.3-1.8 mm long, widely spaced in the branches, inclined to reflexed, reddish when immature; glumes 1-1.2 mm long, equal, shorter than the lemma, glabrous, 1-veined, reddish especially near the base, apex obtuse to rounded, often irregular and minutely ciliate; lemma 1.3-1.8 mm long, widely ovate to lanceolate, glabrous, apex widely rounded to acute, reddish to slightly brown; palea 1.3-1.8 mm long, lanceolate, glabrous, apex rounded to acute; anthers 0.6-1.3 mm long, purplish. Caryopsis 1-1.2 mm long, fusiform, reddish-brown.

DISTRIBUTION AND HABITAT. Muhlenbergia capillipes grows on sandy soils, rocky plains, and canyon walls in pine–oak forests at elevations of 1,400–2,400 m. It is an endemic species from Mexico growing in Chihuahua, Durango, and Sonora.

Muhlenbergia capillipes is morphologically similar to *M. majalcensis*, but the former differs in having glumes shorter than the lemma.

213. *Muhlenbergia cenchroides* (Humb. & Bonpl. ex Willd.) P. M. Peterson, Caldasia 31(2): 280, f. 2C–D. 2009. *Aegopogon cenchroides* Humb. & Bonpl. ex Willd.

Muhlenbergia brevigluma (Scribn.) Columbus.

Caespitose annual; slender, sometimes producing stolons. Culms 30-40(50) cm tall, decumbent. Sheaths glabrous to puberulent; ligules 1.5-4.5 mm long, eciliate membrane; blades 2-11 cm long, 1-2 mm wide, scabrous or puberulent. Panicles 2-8 cm long, spreading, composed of unilateral racemes, racemes born along a central axis, bearing a triad of spikelets. Spikelets 4-6 mm long, central spikelet perfect, 3.5-5.5 mm long, sessile or with a pedicel less than 0.5 mm long; lateral spikelets pediceled, staminate to rudimentary, pedicel a little longer, purple; glumes 3-5 mm long, 1-veined, linear to oblong, lobed, lobes acute, awned on apex, awn 1-3 mm; fertile lemma 2-3 mm long, laterally compressed, glabrous, membranous, dark brown, keeled, 3-veined, lateral veins ribbed, lemma apex 3-lobed, lobes lanceolate, acuminate, 3-awned, outer lobes longer; principal lemma awn 4-7 mm long; lateral lemma awns 1-2 mm long; palea 2.5-3 mm long, lanceolate, minute-pubescent dorsally, teeth awned, the awn 0.5-2 mm long; anthers 0.5-2 mm long, yellow. 2n = 40, 60, 80.

DISTRIBUTION AND HABITAT. Muhlenbergia cenchroides grows in humid areas in pine-oak forests at elevations of 1,600–2,320 m. It ranges from the United States and Mexico in Chiapas, Guerrero, Michoacán, Nayarit, Oaxaca, and Querétaro to Central and South America.

Delicate annual plants. Culms (7)10-30 cm tall, slender, loose, glabrous, often branched from the inferior nodes. Sheaths 1.5-5 cm long, rounded, glabrous or sparsely pilose; ligules 0.3-0.9 mm long, membranous pilose and/or erose; blades 1.5-4 cm long, 1-1.5(2) mm wide, folded or involute, glabrous to scattered pilose, often reflexed or spreading. Panicles 4–12 cm long, 1.8-5 cm wide; branches (1)1.5-2 cm long, some distant, widely spreading or reflexed, spikelet-bearing to the base. Spikelets 2–2.5 mm long, appressed to the branches and overlapping; glumes subequal, glabrous, acuminate or shortly awned, lower glumes 0.7-1.5 mm long, upper glumes 1-1.8 mm long; lemma 2-2.2(2.5) mm long, lanceolate, 3-veined, often appearing 5-veined, lateral veins ciliate to the apex, rarely only scabrous, the awn 5-7(10) mm long; palea 1.6-2.4 mm long, narrowly lanceolate; anthers 0.3-0.5 mm long, yellowish changing to pale with age. Caryopsis 0.8-1.8 mm long, narrowly fusiform, brown-reddish. n = 10.

DISTRIBUTION AND HABITAT. Muhlenbergia ciliata grows in xerophilous scrub and pine or oak forests at elevations of 1,880–2,400 m. This species is widely distributed in Mexico, Central America, and South America.

216. Muhlenbergia decumbens Swallen, Bol. Soc. Bot. México 23: 30–32, f. 4. 1959. Chaboissaea decumbens (Swallen) J. & C. Reeder, Phytologia 65(2): 156. 1988.

Annual; delicate. Culms 12–30 cm tall, decumbent, branched and rooting at the lower nodes. Sheaths ½ the length of internodes,

glabrous with hyaline margins; ligules 1.6–2.5 mm long, hyaline, entire, the apex truncate; blades 2.5-8 cm long, 0.8-1.4 mm wide, flat, scaberulous, margins scabrous to the apex. Panicles (4)8-11 cm long, 1.5–4.5 cm wide, narrow, branches 2.5–4.8 cm long, ascending; pedicels 1-3 mm long, rigid, scabrous. Spikelets 3-3.8 mm long, 1- or 2-flowered, erect, plumbeous; glumes 1.8-3.2 mm long, subequal, grayish, glabrous and scabrous on midveins, apex acuminate to mucronate, the mucro 0.6 mm long, lower glume 1.8-2.5 mm long, upper glume 2.4-3.2 mm long, wider than lower; lemma 3-3.8 mm long, lanceolate, compressed-keeled toward the apex, awned or awnless, appressed-pubescent on margins on the lower 1/3, dark green to gray with light greenish-white spots, apex long acuminate, the awns 0.2-3 mm long; palea similar to the lemma, veins extended into small mucros 0.3-0.6 mm long; anthers 0.9-1.1 mm long, greenish. Caryopsis 2-2.3 mm long, fusiform, brown. n = 16.

DISTRIBUTION AND HABITAT. Muhlenbergia decumbens is endemic to Chihuahua and grows in sandy clay loam to dark clay soils along sloughs and wet depressions in pineoak-juniper woodlands (Peterson and Annable, 1992).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Casas Grandes: W of Casas Grandes, 5 mi S of Hernández, 18 Sep 1960, pine-oak region, 2100 m, Reeder, C. Reeder & Soderstrom 3510 (NMC, US). 217. Muhlenbergia depauperata Scribn., Bot. Gaz. 9: 187, f. 1–2. 1884.

FIGURE 157

Caespitose annual. Culms 3–15 cm tall; internodes mostly scaberulous or pubescent, pubescent or strigose below the nodes, very branched at the lower nodes. Sheaths often longer than the internodes, somewhat inflated, smooth or scabrous, keeled, margins scarious; ligules 1.4–2.5 mm long, membranous, acute, with lateral lobes; blades 1–3 cm long, 0.6–1.5 mm wide, flat or involute, scabrous to strigose, midveins and margins thickened, whitish. Panicles 2.5–8.5 cm long, 0.5–0.7 cm wide, contracted; primary branches 1–2.2 cm long, appressed, spikelet-bearing to the base, spikelets borne in subsessile-pedicellate pairs; longer

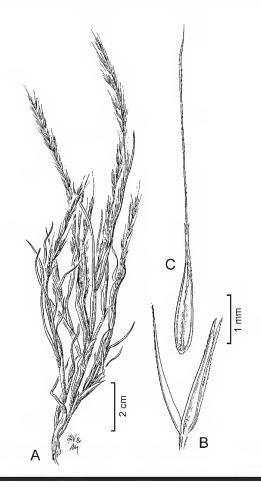

FIGURE 157. Muhlenbergia depauperata. A. Habit. B. Glumes. C. Floret. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

pedicels 3–6 mm long, scabrous; disarticulation beneath the spikelet pairs at the base of pedicel. Spikelets 2.5–4.5 mm long, appressed; glumes 2.3–5.1 mm long, equaling or exceeding the florets; lower glumes 2.3–4 mm long, subulate, 2-veined, minutely to deeply bifid, teeth awnless or with awns to 1.3 mm long; upper glumes 3–5.1 mm long, lanceolate, 1-veined, entire, acuminate; lemmas 2.5–4.5 mm long, narrowly lanceolate, light greenish-brown to purplish, scabrous, appressed-pubescent on the margins and midveins, apex acuminate, awned, the awns 6–15 mm long, stiff; paleas 2.4–3.6 mm long, lanceolate, intercostal region appressed-pubescent, apex acuminate; anthers 0.5–0.8 mm long, purplish to yellowish. Caryopsis 1.5–2.3 mm long, narrowly fusiform, brownish. 2n = 20.

DISTRIBUTION AND HABITAT. Muhlenbergia depauperata grows in gravelly flats, rock outcrops, exposed bedrock, sandy banks, and grama grassland associations, usually on soils derived from calcareous parent materials, and associated with species of Selaginella, Hechtia, Opuntia, Salvia,

and *Juniperus* at 1,530–2,400 m. Its range extends into the southwestern United States, and in Mexico this species occurs in Aguascalientes, Chihuahua, Distrito Federal, Durango, Guanajuato, Jalisco, México, Oaxaca, Puebla, San Luis Potosí, and Veracruz.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Jiménez: Presón del Apache, upper part of Canyon del Apache, SE quadrant of Sierra del Diablón, 1650 m, F. Chiang, T. Wendt & M.C. Johnston 9028 (MEXU); Sta. Eulalia Mts, C.G. Pringle 404 (US). Matamoros: Just N of Villa Matamoros on Hwy 45 towards Parral, 1700 m, P.M. Ocampo: Parque Nacional Cascada Basaseachic, 1 km airline S of Cascada, 2100 m, Tenorio & R. Torres 4511-a (IBUG).

218. Muhlenbergia distichophylla (J. Presl) Kunth, Enum. Pl. 1: 202, 1833.

Caespitose perennial. Culms 100-180 cm tall, erect, glabrous to pubescent below the nodes; internodes glabrous. Sheaths 8-42 cm long, longer than basal internodes, glabrous, the keels prominent, sometimes coiled to shredded below, basal sheaths compressed-keeled; sheath auricles 0.4-2.6 cm long, on lower portions and to 6.4 cm above; ligules 4-15 mm long, membranous, apex finely lacerate sometimes almost to the base; blades 18-90 cm long, 2-7 mm wide, flat or folded, scaberulous to scabrous in boths sides, the margins and keel saw-toothed. Panicles 35-70 cm long, 4-15 cm wide, densely flowered, oblong, sometimes lax near apex, greenish-brown, sometimes reddish-purple; primary branches 2-15 cm long, without spikelets near the base, appressed to loosely spreading up to 60° from the rachises; pedicels 0.2-4 mm long, glabrous to scaberulous. Spikelets 1.5-2.8(3) mm long, erect, greenish-brown, to reddishpurple; glumes 1.2-2.8 mm long, longer, as long as, or a little shorter than the lemma, subequal, oblong to narrowly oblong, faintly 1-veined, hyaline, glabrous to scaberulous, usually with faint, widely scattered hairs, the hairs less than 0.1 mm long, apex acute to acuminate; upper glumes rarely mucronate, the mucro to 0.4 mm; lemmas 1.4-2.7 mm long, lanceolate to linearlanceolate, awned, glabrous or sometimes the margins on the lower 1/3 pubescent, the hairs to 0.2 mm long, rarely the lower 1/3 with scattered hairs, callus usually short pilose, apex acute, minutely bifid, the teeth to 0.5 mm long, the awn 4-16 mm long, flexuous, often reddish-purple near base; paleas 1.3-2.7 mm long, glabrous or with few hairs between the veins on the lower 1/3, apex acute; anthers 1.2–1.5 mm long, yellowish, sometimes reddish tinged.

DISTRIBUTION AND HABITAT. Muhlenbergia distichophylla occurs from central Mexico in Chiapas, Guerrero, Jalisco, México, and Oaxaca to Guatemala; found in open pine-oak forests and tropical deciduous forests on rocky slopes, canyons, and ravines, with *Pinus* spp. and *Quercus* spp. at 400–2,000 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chinipas: 1 mi E of Saguarivo, 10 Sep 2008, small arroyo with oaks and pines, 1490 m, *P.M. Peterson & J.M. Saarela 22160* (US). 219. *Muhlenbergia diversiglumis* Trin., Mém. Acad. Imp. Sci. St.-Pétersbourg. Ser. 6, Sci. Math., Seconde Pt. Sci. Nat. 6, 4(3–4): 298. 1841.

FIGURE 158A-D

Delicate, sprawling annual. Culms 20–50(70) cm tall, glabrous and glossy, inferior nodes retrorse-pilose, rooting at the lower nodes. Sheaths papillose-pilose to glabrous, the hairs up

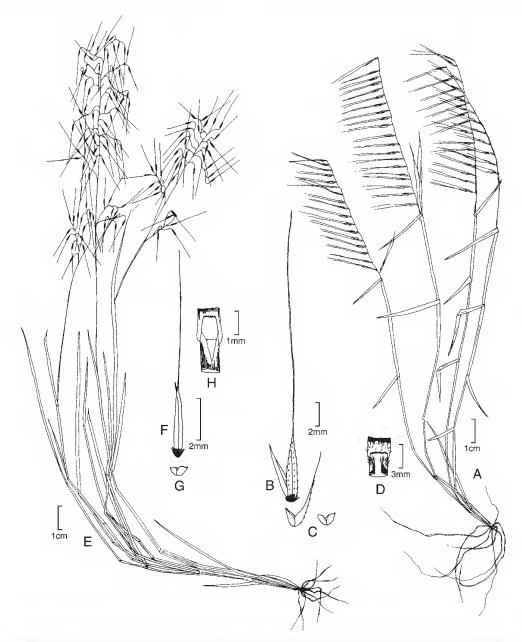

FIGURE 158. Muhlenbergia diversiglumis. A. Habit. B. Floret. C. Glumes. D. Ligule. Muhlenbergia implicata. E. Habit. F. Floret. G. Glumes. H. Ligule. Drawn by Midge Gillete for PMP.

to 3 mm long; ligules 0.5-1 mm long, apex erose; blades 1.5-4(6) cm long, 1–1.5(2) mm wide, flat or loosely involute, glabrous, papillose-pilose near the base and margins. Panicle 4-10(15) cm long, 2-4.5 cm wide, pale green or sometimes purple; branches 10-20 cm long, 1-2 cm wide, spreading at right angles to the culm and reflexed or secund, disarticulating at the base with spikelets appressed and falling as a unit. Spikelets dimorphic, 2-5 on each branch, pedicels 1–5 mm long, scabrous or short papillose-pilose; glumes 0.2-8 mm long, dimorphic; proximal spikelets of each branch 0.2-0.7 mm long, orbicular, apex irregularly toothed to erose, subequal; distal spikelets the glumes unequal; lower glumes 5–8 mm long, ovate, apiculate, awned, the awn 1–2.5(7) mm long; upper glumes 0.2-0.7 mm long, orbicular, apiculate, occasionally awned; lemma 4-7.5 mm long, glabrous to papillose-scabrous with 3 prominent usually greenish veins, apex awned, the awn of 5–19 mm long; palea 3.7–6.8 mm long, attenuate, the veins prominent, sometimes 2-toothed, scabrous between the veins; anthers 0.4-0.8 mm long, yellowish. Caryopsis 1.8-3 mm long, oblongovoid, flattened, brown. n = 10.

DISTRIBUTION AND HABITAT. *Muhlenbergia diversiglumis* occurs in pine or oak forests at elevations of 1,700–2,000 m. It ranges from Mexico to Central and South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Sierra Charuco, Río Fuerte, 1700 m, Gentry 1761 (CHAPA). Chínipas: Sierra Milpillas, 24.1 mi E of Los Tanques on road to Milpillas, 2100 m, P.M. 220. *Muhlenbergia dubia* E. Fourn., Biol. Cent.-Amer., Bot. 3(29): 540. 1885.

FIGURE 159F-I

Densely caespitose perennial. Culms 30–100 cm tall, erect, not rooting at the lower nodes; internodes glabrous, minutely pubescent to hirtellous below the nodes. Leaf sheaths longer than the internodes, smooth or scaberulous, rounded basally; ligules 4-10 mm long, membranous, firm below, acute, lacerate, brownish; blades 10-60 cm long, 1-2 mm wide, usually involute (occasionally flat), scabrous abaxially, hirsute adaxially. Panicles 10–40cm long, (0.6)1–2.4 cm wide, contracted, grayish-green; primary branches 0.6-7 cm long, diverging to 40° from the rachises, stiff, spikelet-bearing to the base; pedicels 0.1-6 mm long, strongly divergent, hirsute. Spikelets 3.8-5 mm long, grayishgreen; glumes (1.8)2–3 mm long, equal, shorter than the florets, glabrous and smooth proximally, scaberulous distally, faintly 1-veined, acute; lemmas 3.8-5 mm long, narrowly lanceolate, calluses hairy, hairs to 0.5 mm long, lemma bodies glabrous and smooth below, scabrous distally, apex acuminate, awnless, mucronate or awned, the awns 1-6 mm long, straight; paleas 3.8-5 mm long, narrowly lanceolate, glabrous below, acuminate; anthers 1.5–2.2 mm long, greenish. Caryopsis 2.5–3.5 mm long, fusiform, brownish. 2n = 40, 50.

DISTRIBUTION AND HABITAT. Muhlenbergia dubia grows on steep slopes, ridge tops, limestone rock outcrops, and along draws with Juniperus flaccida, Quercus spp., and Pinus ponderosa at 1,500–3,200 m. Its range extends from western Texas and southern New Mexico to Mexico, where this species occurs in Aguascalientes, Chihuahua, Durango, Distrito Federal, Guanajuato, Hidalgo, Jalisco, México, Michoacán, Oaxaca, Puebla, Querétaro, San Luis Potosí, Tlaxcala, Veracruz, and Zacatecas.

221. *Muhlenbergia dumosa* Scribn. ex Vasey, Contr. U.S. Natl. Herb. 3(1): 71. 1892.

FIGURE 160

Densely caespitose perennial; rhizomes elongated. Culms 50–150(300) cm tall, bamboo-like, woody at base, emerging from a scaly rhizome 2–5 mm in diameter, freely branched at superior and central nodes, pubescent to glabrous below the nodes, branches fastigiated and numerous, central culm and proximal branches covered with sheaths until growth. Sheaths glabrous; ligules 0.3–0.5 mm long, truncate, erose; blades 2–5(10) cm long, 0.5–1.5 mm wide, flat or finely involute, articulate at the base and deciduous at the sheath apex. Panicles 1–3(4) cm long,

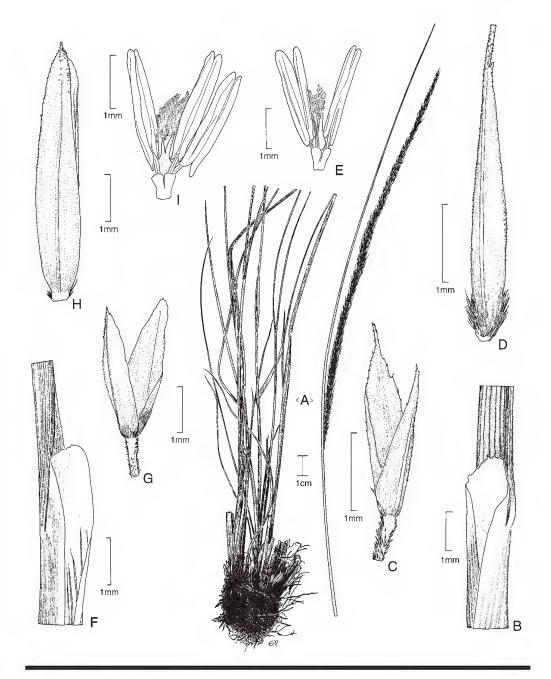

FIGURE 159. Muhlenbergia palmeri. A. Habit. B. Ligule. C. Glumes. D. Floret. E. Lodicules, pistil, and stamens. Muhlenbergia dubia. F. Ligule. G. Glumes. H. Floret. I. Lodicules, pistil, and stamens. Drawn by Elisabeth P. Roberts for Smithsonian Institution, Department of Botany.

0.3–1.3 cm wide, numerous and flexuous, pedicels 0.1–1.5 mm long. Spikelets 2.2–3.1 mm long, greenish or purplish; glumes 1–1.7 mm long, shorter than spikelet, subequal, 1-veined, persistent; lower glumes 1–1.3 mm long, mucronate, the mucro 0.5–1 mm long; upper glumes 1.3–1.7 mm long, mucronate or awned,

the awn 0.6-2 mm long; lemma 2-2.2 mm long, membranous, pale or occasionally purplish, glabrous with green veins, awned, the awn (3)5-11 mm long; palea 2-2.2 mm long, similar to lemma; anthers 1.2-2 mm long, purple. Caryopsis 1.2-1.6 mm long, fusiform, reddish-brown. 2n = 40.

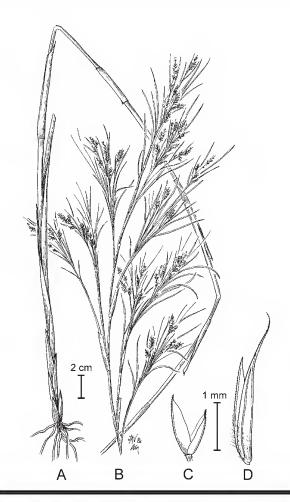

FIGURE 160. Muhlenbergia dumosa. A. Habit. B. Culm and inflorescence. C. Glumes. D. Floret. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

DISTRIBUTION AND HABITAT. Muhlenbergia dumosa grows in pine-oak forests and tropical forests at elevations of 1,700–2,100 m. It ranges from the southwestern United States to Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 69.2 km al E de Guachochi and 25.7 km W of Balleza, 26 Sep 1988, 2100 m, P.M. Peterson & Annable 5942 (US); 11 mi SE of Balleza on road to Parral, 1800 m, P.M. Peterson, M.B. Knowles, C.H. Dietrich & S.M. Braxton 13526 (US). 222. *Muhlenbergia elongata* Scribn. ex Beal, Grass. N. Amer. 2: 251. 1896.

FIGURE 161E-H

Caespitose perennial; never rhizomatous. Culms 40-120 cm tall, erect, not branched, glabrous, sometimes scabrous below the nodes. Sheaths glabrous to scabrous, rounded to base; ligules 2-8 mm long, firm below, membranous to the apex, apex obtuse or acute; blades 15-50 cm long, 0.5-1.5 mm wide, flat to involute, glabrous to scabrous. Panicles 15-50 cm long, 1-7 cm wide, loosely contracted not dense, branches 1-8 cm long, appressed to barely divergent, naked basaly; pedicels 1.3-8 mm long, hirsute. Spikelets 3-4.2 mm long, straw-colored at maturity; glumes 2-3 mm long, slightly shorter than the lemma, subequal, glabrous at the base, minutely pubescent to scabrous near the apex, 1-veined, apex acuminate to acute, sometimes awned, the awn 1-1.6 mm long; lemma 2.8-4.2 mm long, narrow-lanceolate, glabrous at the base, scabrous near the apex, apex acuminate, awned, the awn 10-40 mm long, straight to flexuous; palea 2.8-4.2 mm long, narrowly lanceolate, glabrous acuminate; anthers 1.4-2.2 mm long, yellow. Caryopsis 2–2.2 mm long, fusiform, brown.

DISTRIBUTION AND HABITAT. *Muhlenbergia elongata* grows in rhyolitic conglomerate or volcanic substrates on rocky slopes and canyon walls at elevations of 1,500–2,400 m. It ranges from the United States to Mexico in Chihuahua, Hidalgo, and Sonora.

223. *Muhlenbergia eludens* C. Reeder, J. Wash. Acad. Sci. 39: 365–366, f. 1B. 1949.

Caespitose annual. Culms 10-40 cm tall, erect, strigulose below the nodes, internodes glabrous. Sheaths scabrous to puberulent, keeled, margins brown-yellowish; ligules 1.5-2.5 mm long, membranous, acute, lacerate to erose; blades 2-8 cm long, 0.8-2 mm wide, involute, occasionally flat, minute-pilose to scabous. Panicles 14-24 cm long, 3-7 cm wide, spreading, open, narrowly pyramidal; branches 2-7 cm long, narrowly spreading and ascending, 1-3 per node; pedicels 1-2(3) mm long, usually shorter than the florets, slender, appressed to branches or occasionally erect. Spikelets 1.7-2.5 mm long; glumes 1.3-1.8 mm long, subequal, 1-veined; lower glumes 1.3-1.6 mm long, acuminate to sometimes mucronate, mucros 0.5 mm long; upper glumes 1.4-1.8 mm long, acuminate, wider than the lower glume, apex acuminate; lemma 1.7-2.5 mm long, lanceolate, purple to yellowish or light brown, appressed silky-pubescent along the midvein and margins, the hairs 0.3-0.5 mm long, apex awned, the awn 1.2-3.5 mm long, delicate, emerging between 2 small teeth; paleas 1.8-2.4 mm long, oblong-elliptic, glabrous; anthers 0.4–0.6 mm long, purplish. Caryopsis 1.3–2.3 mm long, fusiform, slightly compressed dorsally, light brownish, n = 20.

DISTRIBUTION AND HABITAT. Muhlenbergia eludens grows in grasslands and oak-pine forests at elevations of 1,800–2,680 m. It ranges from the United States to northern Mexico in Chihuahua, Durango, and Sonora.

FIGURE 162J-M

Densely caespitose perennial. Culms (65)80-150(200) cm tall, erect, stout, not conspicuously branched; internodes smooth for most of their length, smooth or scaberulous below the nodes. Sheaths 7-35 cm long, shorter or longer than the internodes, glabrous or puberulent, basal sheaths compressed-keeled, sheath auricles missing; ligules 10-25 mm long, membranous throughout, acuminate, lacerate, slightly firmer below; blades 20-50 cm long, 2-6 mm wide, flat or folded, scabrous abaxially, smooth or scaberulous adaxially, margins coarsely scabrous. Panicles 20-45 cm long, 4-7(15) cm wide, loosely contracted to open, light purplish to light brownish; primary branches 9-17 cm long, lax, loosely appressed or diverging to 70° from the rachises, naked basally; pedicels 0.5-3 mm long, erect, smooth or scaberulous. Spikelets 2.2-3.2 mm long; glumes 2.2-3.2 mm long, longer or as long as the lemma, subequal, scaberulous to scabrous, faintly 1-veined, acute to obtuse, usually unawned, occasionally mucronate, mucro to 0.2 mm long; lemmas 2-3 mm long, oblong-elliptic, pubescent along the midvein and margins on the lower ½-¾, apex acute, usually awned, sometimes awnless or mucronate, awns generally (1)6-15 mm long, flexuous, purplish; paleas 1.8-2.9 mm long, oblong-elliptic, acute; anthers 1.2-1.6 mm long, yellowish to purplish. Caryopsis 1.3–1.6 mm long, fusiform, reddish-brown. 2n =24, 26, 28, 30, 40, 42, 46, 60, 64.

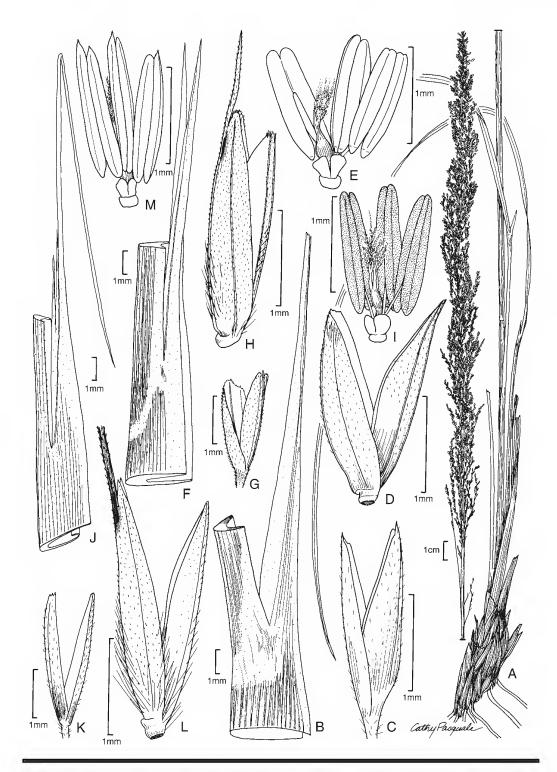

FIGURE 162. Muhlenbergia lindheimeri. A. Habit. B. Ligule. C. Glumes. D. Floret. E. Lodicules, pistil, and stamens. Muhlenbergia longiligula. F. Ligule, G. Glumes. H. Floret. I. Lodicules, pistil, and stamens. Muhlenbergia emersleyi. J. Ligule. K. Glumes. M. Lodicules, pistil, and stamens. Drawn by Cathy Pasquale for Smithsonian Institution, Department of Botany.

DISTRIBUTION AND HABITAT. Muhlenbergia emersleyi grows on rocky slopes, gravelly washes, canyons, and cliffs, and along streams often derived from limestone parent material associated with oak–pinyon–juniper woodlands at 1,200–2,600 m. It occurs in western Texas, New Mexico, and Arizona and is common throughout Mexico.

225. *Muhlenbergia filiformis* (Thurb. ex S. Wats.) Rydb., Bull. Torrey Bot. Club 32(11): 600. 1905.

Annual (often appearing perennial); tufted. Culms (3)5-20(35) cm tall, erect or geniculate, often rooting at the lower nodes; internodes glabrous. Sheaths shorter or longer than the internodes, glabrous, smooth or scaberulous; ligules 1-3.5 mm long, hyaline to membranous, rounded to acute; blades 1-4(6) cm long, 0.6-1.6 mm wide, mostly basal, numerous, flat or involute, smooth or scaberulous abaxially, scabrous or pubescent adaxially. Panicles 1.6-6 cm long, 0.2-0.5 cm wide, spikelike, interrupted near the base, long-exserted; primary branches 0.9–1.2 cm long, closely appressed at maturity; pedicels 1–3 mm long, scabrous. Spikelets 1.5-3.2 mm. Glumes greenish-gray, glabrous, 1-veined, rounded to subacute; lower glumes 0.6-1.4 mm; upper glumes 0.7–1.7 mm; lemmas (1.5)1.8–2.5(3.2) mm long, lanceolate, dark greenish, appressed-pubescent on the margins and midveins, hairs shorter than 0.3 mm long, apex scaberulous, acute to acuminate, unawned, sometimes mucronate, mucros shorter than 1 mm; paleas 1.6-2.6(3.1) mm long, lanceolate, scaberulous distally; anthers 0.5–1.2 mm long, purplish. Caryopsis 0.9-1.5 mm long, fusiform, reddish-brown. 2n = 18.

DISTRIBUTION AND HABITAT. Muhlenbergia filiformis grows in open, moist meadows, on gravelly lake shores, along stream banks, and in moist humus near thermal springs at elevations of 1,060–3,050 m. It is usually associated with yellow (three-needled) pine forests, but also grows in many other plant communities. It occurs in Canada, the United States, and extends into northern Mexico.

226. Muhlenbergia flavida Vasey, Contr. U.S. Natl. Herb. 1(8): 282. 1893.

FIGURE 163A-D

Caespitose delicate annual. Culms 7–40 cm tall, erect, occasionally decumbent, strigulose below nodes. Sheaths glabrous to scaberulous, margins greenish-yellow; ligules 1.5–3 mm long,

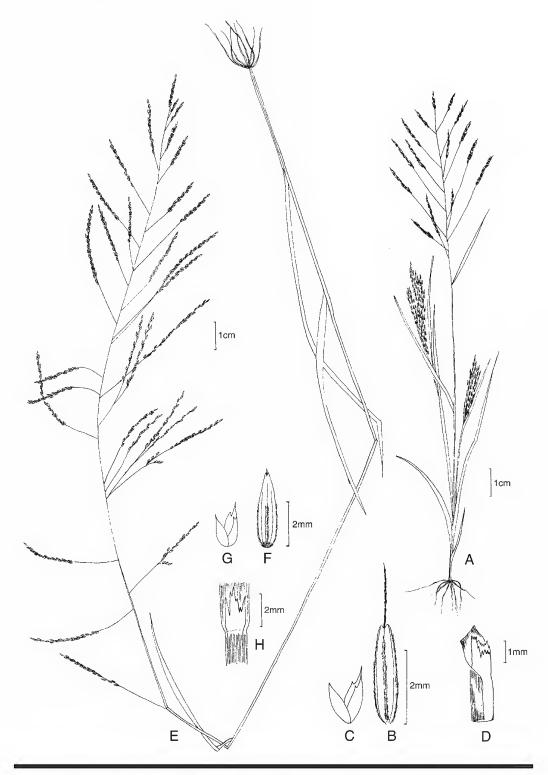

FIGURE 163. *Muhlenbergia flavida*. A. Habit. B. Lemma, C. Glumes. D. Ligule. *Muhlenbergia schmitzii*. E. Habit. F. Lemma. G. Glumes. H. Ligule. Drawn by Midge Gillete for PMP.

membranous, apex obtuse to acute, lacerate to erose; blades 2-9 cm long, 0.4-1.8 mm wide, involute to folded, occasionally flat, sparsely minute-villous above, glabrous to sparsely scaberulous below. Panicles 10–16 cm long, (1)3–6.5 cm wide, narrowly pyramidal; branches 1.6-4 cm long, 1-3 per node, ascending or some divergent, naked to the base with scattered florets; pedicels 0.7-1.5 mm long, slender, appressed, less than ½ as long as the floret. Spikelets 2.2-3 mm long, broad and dorsally flattened, stramineous to yellow, appressed along the branches; glumes 1.5-2 mm long, almost equal, glabrous, 1-veined, ovate lanceolate, awned, awns to 0.8 mm long, lower glume gradually acuminate, upper glume generally abruptly acuminate; lemma 2.2-3 mm long, membranous, yellowish when mature, oblongellipsoid, 3-veined, silky-pubescent on margins and midvein to the base, appressed hairs to 0.4 mm long, apex 2-toothed, teeth minute to 0.2 mm long, awn 1-3 mm long, delicate, emerging between lobes; palea 2.2–3 mm long, oblong-ellipsoid, glabrous, apex with 2 minute teeth to 0.2 mm; anthers 0.4-0.6 mm long, olive-green to light brown. Caryopsis 1-1.7 mm long, oblong, compressed, light brown to yellowish.

DISTRIBUTION AND HABITAT. Muhlenbergia flavida grows in pine-oak forests at elevations of 1,900–2,100 m. It is known from Mexico in Chihuahua, Durango, Hidalgo, Jalisco, Michoacán, Nayarit, Sinaloa, and Sonora.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chínipas: Sierra Milpillas 28.1 mi E of Los Tanques on road to Chínipas, 1.6 mi N of Los Chinicas, 2100 m, P.M. Peterson & Annable 4173, 4174 (MEXU, US). 227. Muhlenbergia flaviseta Scribn., U.S.D.A. Div. Bot. Bull. 8: 11, t. 7. 1897.

Caespitose perennial. Culms 20–30 cm tall, glabrous. Leaf blades mostly basal, sheaths puberulent to glabrous, papery with age; ligules 0.2–0.5 mm long, hyaline, truncate and fimbriate; blades 2–7(8.5) cm long, 1.5–2 mm wide, flat, glabrous to scabrous, apex largely acuminate. Panicles 2–5 cm long, 1–2 cm wide, long-exserted, very branched, branches 2.5–3 cm long, ascending, appressed, central axes flattened with 2 ribs, glabrous to scabrous. Spikelets 3.5–4 mm; glumes unequal, greenish, glabrous, oblong-lanceolate; lower glumes (0.5)1–1.8 mm long, 1-veined, mucronate; upper glumes (3)3.5–4.2 mm long, 1- to 3-veined, 3-toothed; lemma (3)3.8–4 mm long, subulate, green to straw color, glabrous, apex entireand awned, the awn 14–16 mm long, yellow, flexuous, scabrous at the base; palea

2.8–3.2 mm long, straw-colored, glabrous; anthers 1.5–2 mm long, oblong, purplish. 2n = 20.

DISTRIBUTION AND HABITAT. Muhlenbergia flaviseta grows in pine-oak forests and grasslands with scattered oaks at elevations of 1,900–2,400 m. This Mexican endemic occurs in the Sierra Madre Occidental and is found in Chihuahua and Durango.

228. Muhlenbergia fragilis Swallen, Contr. U.S. Natl. Herb. 29(4): 206. 1947.

FIGURE 164

Caespitose annual. Culms 10-38 cm tall, erect or spreading; scabrous or strigulous below the nodes; internodes mostly glabrous, smooth or scaberulous. Sheaths 2.4-4.2 cm long, often longer than the internodes, scaberulous, margins hyaline; ligules 1-3 mm long, hyaline, obtuse, irregularly toothed to lacerate, with lateral lobes extended into auricles; blades 1-10 cm long, 0.4-2 mm wide, flat, scabrous abaxially, strigulose adaxially, margins and midveins whitish-thickened; panicles 10-24 cm long, 3.5-11 cm wide, diffuse; primary branches 2.2-6.2 cm long, capillary, diverging 80°-100° from the rachises, straight; pedicels 6-10 mm long, delicate. Spikelets 1-1.2 mm long, appressed to slightly divergent from branch axes; glumes 0.5-1 mm long, equal to subequal, 1-veined, glabrous throughout or obscurely puberulent, hairs about 0.06 mm long, apex obtuse or subacute; lemmas 1-1.2 mm long, oblong-elliptic, membranous, purplish to light brownish, not mottled, glabrous or densely appressed-puberulent on the margins and midveins, apex obtuse,

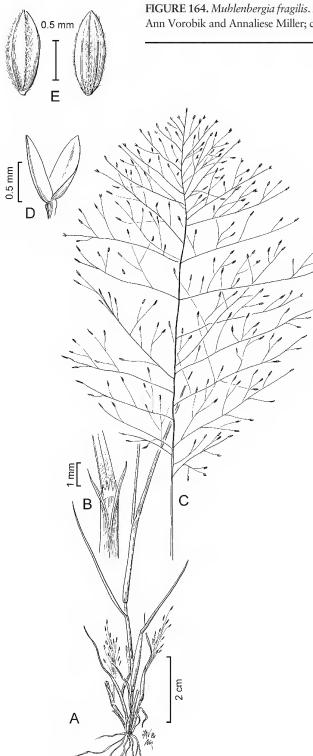

FIGURE 164. Muhlenbergia fragilis. A. Habit. B. Ligule. C. Inflorescence. D. Glumes. E. Florets. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

awnless; paleas 0.9–1.2 mm long, oblong-elliptic, densely puberulent between the veins or glabrous, apex obtuse; anthers 0.3–0.5 mm long, purplish. Caryopsis 0.7–0.9 mm long, elliptic, reddish-brown. 2n = 20.

DISTRIBUTION AND HABITAT. Muhlenbergia fragilis grows on rocky talus slopes, cliffs, canyon walls, roadcuts, and sandy slopes, often on calcareous substrates, at elevations of 480–2,200 m from southeastern California to western Texas to south into Mexico in Baja California, Chiapas Chihuahua, Guanajuato, Guerrero, Jalisco, Michoacán, Morelos, Nayarit, Oaxaca, Puebla, Querétaro, San Luis Potosí, Sinaloa, Sonora, and Veracruz. It is usually found in oak–grama savannahs, thorn scrub forests, oak–yellow pine forests, and pinyon–juniper woodlands.

229. *Muhlenbergia gigantea* (E. Fourn.) Hitchc., N. Amer. Fl. 17(6): 460. 1935.

FIGURE 165F-J

Strongly caespitose perennial. Culms 120-300 cm tall, erect, compressed-keeled near the base, glabrous below the nodes to sometimes scaberulous. Sheaths 12-32 cm long, shorter than internodes, sometimes purplish near base, often changing to brown with age, keels prominent and glabrous; ligules (5)8-15 mm long, membranous, apex lacerate; blades 35-110 cm long, 5-10 mm wide, flat, scaberulous adaxially and glabrous abaxially, margins and keels serrate. Panicle 35–100 long, (8)15– 30 cm wide, purple or brown-purplish, branches ascending or pendulous spreading up to 60° from culm axis; pedicels 0.2-2.5 mm long, generally shorter than spikelets, scaberulous; primary branches 6-25 cm long, naked near the base, pendulous to flexuous. Spikelets 1.3-2.6 mm long, erect, purple to brownishpurple; glumes 1.3-2.6 mm long, ovate, generally longer than florets, subequal, 1-veined, often transluscent, usually glabrous to scaberulous, apex acute to obtuse; lemma 1.3-2.3 mm long, oblong, awnless, rarely mucronate, glabrous; palea 1.3-2.3 mm long, glabrous, apex acute to obtuse; anthers 0.9–1.3 mm long, yellow to purplsih. Caryopsis 1-1.3 mm long, fusiform, reddishbrown. 2n = 20, 24.

DISTRIBUTION AND HABITAT. Muhlenbergia gigantea grows in pines or pine–oak forests and tropical forests with Liquidambar, Nyssa, and Sabal, at elevations of 600–2,300 m. In Mexico, this species is known to occuri in Chiapas, Chihuahua, Durango, Guanajuato, Guerrero, Hidalgo, Jalisco, México, Michoacán, Oaxaca, Puebla, San Luis Potosí, Sinaloa, and Veracruz.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Uruáchi: 9 mi E of Yecora on Hwy 16 towards Maycoba and 10.7 mi S on a dirt road towards Talayote, 1800 m, *P.M. Peterson & Annable 12481* (US).

230. Muhlenbergia glauca (Nees) B. D. Jacks., Index Kew. 2: 269. 1895.

FIGURE 166A-D

Perennial; with slender, creeping, well-developed rhizomes. Culms 25–60 cm tall, often decumbent, moderately stiff,

sometimes erect; internodes mostly scabrous, retrorsely hirsute below the nodes. Sheaths longer than the internodes, scaberulous; ligules 0.5-2 mm long, truncate to obtuse, erose or lacerate; blades 4–12 cm long, 1–2.6 mm wide, flat to involute distally, not arcuate, scabrous abaxially, hirsute or scabrous adaxially. Panicles 4-12(17) cm long, 0.3-2.4 cm wide, contracted, interrupted below; primary branches 0.3-3 cm long, usually appressed, occasionally diverging to 30° from the rachises; pedicels 0.1-1.2 mm long, scabrous to hirsute. Spikelets 2.4-3.5 mm long; glumes 1.5–3.5 mm long, ½ to about as long as the lemma, equal, 1-veined, veins scabrous, apex acute or acuminate, usually mucronate or awned, awns, if present, to 1.5 mm long; lemmas 2.4-3.4 mm long, elliptic, pubescent on the lower ½ of the midveins and margins, hairs to 0.6 mm long, tawny, apex acuminate to acute, awned, awns 0.1-3(5) mm long, straight; paleas 2.2-3.4 mm long, elliptic, intercostal region pubescent on the lower ½, apex acuminate to acute; anthers 1.8–2.4 mm long, orange, rarely purplish. Caryopsis 1.7-2 mm long, fusiform, brownish. 2n = 60.

DISTRIBUTION AND HABITAT. Muhlenbergia glauca grows on calcareous rocky slopes, cliffs, canyon walls, table rocks, and volcanic rock outcrops in open vegetation associated with oak–pinyon–juniper woodlands at 1,200–2,780 m. It extends from southeastern Arizona, southern New Mexico, and southwestern Texas to northern Mexico in Aguascalientes, Chihuahua, Durango, Guanajuato, Hidalgo, Jalisco, México, Distrito Federal, Puebla, and San Luis Potosí,.

glabrous to sparingly pubescent. Sheaths mostly 0.5–4.8 cm long, shorter than the internodes, glabrous to sparingly pilose; ligules 0.6–1.5 mm long, apex mostly truncate, lacerate; blades 1.5–4.5 cm long, 0.5–1.5 mm wide, flat, scaberulent and pubescent above, smooth beneath. Panicles 2–6 cm long, 0.5–1 cm wide,

open, loosely flowered, racemose primary branches 3–5 mm long, 1 per node. Spikelets 1.5–3.2 mm long, often greenish or purplish, the clusters with 1 short-pedicelled spikelet (perfect), the pedicels 0.2–0.6 mm and the other 2 spikelets (staminate or sterile) short-pedicelled, the pedicels about 0.7–1.5 mm long;

glumes (1)1.3–2 mm long, obovate and wider distally, apex shallowly notched, entire or mucronate, the mucro 0.1–0.4 mm long, lobes obtuse or rounded; lemmas 2.5–3.2 mm long, the lateral veins often mucronate, the central vein mucronate to short-awned, the awns never more than 1.5 mm long; paleas 2.2–3 mm long, puberulent, apex 2-mucronate, the mucros less than 0.8 mm long; anthers 0.5–0.8 mm long, yellowish. Caryopsis 1.1–1.3 mm long, obovoid, light brownish.

DISTRIBUTION AND HABITAT. Muhlenbergia imperfecta grows on moist slopes, cliffs, canyons, and roadsides and along or near springs, usually in shaded areas associated with Pinus cooperi C. E. Blanco, P. lumholtzii spp., Quercus spp., Juniperus deppeana Steud., Arctostaphylos pungens, Rhus trilobata Nutt., and Cercocarpus at 1,300–2,860 m. It ranges from southern Arizona throughout most of Mexico and Central America.

233. *Muhlenbergia ligulata* (E. Fourn.) Scribn. & Merr., Bull. Div. Agrostol. U.S.D.A. 24: 19. 1901. *Chaboissaea ligulata* E. Fourn., Mexic. Pl. 2: 112, t. 1. 1886.

Caespitose perennial. Culms 20–70(90) cm tall, erect, glabrous and occasionally purple below the nodes. Sheaths (0.8)2.5–11(31) cm long, keeled, glabrous, margins hyaline; ligules 6–10 mm long, hyaline, apex acuminate, lacerate; blades 10–15(20) cm long, 1–2.5 mm wide, flat to folded or involute, glabrous above and scaberulous below. Panicles 6–28 cm long, 1–10 cm wide, narrow, pyramidal; branches short, appressed or narrowly spreading less than 70° from the culm axis, 1 per node. Spikelets 2.8–3 mm long, 1 or 2(3)-flowered, plumbeous, proximal spikelet perfect and distal spikelet staminate or sterile; glumes 1–4 mm long, subequal, 1-veined, glabrous and scabrous along midveins, apex acute to acuminate, occasionally mucronate, the mucro up to 0.5 mm long; lower glume 1–3.2 mm long; upper glume 1.2–4 mm long; lemma 2.5–3.5(4) mm long, lanceolate, compressed-keeled, with appressed hairs on the midvein and margins on the proximal ½,

green-yellowish with gray spots, apex acuminate to acute, unawned, mucronate or awned, the awn up to 2 mm long; palea 2.4-3.5 mm long, lanceolate, unawned, similar to the lemma, apex acute or obtuse; anthers 1-1.2 mm long, yellow to purple. Caryopsis 1.1-1.3 mm long, fusiform, brown. n = 8.

DISTRIBUTION AND HABITAT. Muhlenbergia ligulata grows in seasonally wet areas in grasslands and oak-pine forests at elevations of 2,000–2,616 m. It is known from Mexico in Aguascalientes, Chihuahua, Distrito Federal, Durango, Guanajuato, Jalisco, México, San Luis Potosí, and Zacatecas.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Carichi: Sánchez, 12 Oct 1910, Hitchcock 7693 (US). Cuauhtémoc: 13.0 mi W of Cuauhtémoc on hwy 16, 20 Sep 1986, 2200 m, P.M. Guerrero: 15 mi E of Guerrero, 4 Sep 1967, Reeder & C. Reeder 4858 (ARIZ).

234. Muhlenbergia lindheimeri Hitchc., J. Wash. Acad. Sci. 24(7): 291. 1934.

FIGURE 162A-E

Strongly caespitose perennial. Culms 50-150 cm tall, stout, erect, not rooting at the lower nodes; internodes mostly glabrous, sometimes puberulent below the nodes. Sheaths 10-45 cm long, shorter or longer than the internodes, glabrous, basal sheaths compressed-keeled, not becoming spirally coiled when old, purplish-brown or yellowish; ligules 10–35 mm long, decurrent, firm and brown basally, membranous distally, acuminate; blades 25-55 cm long, 2-5 mm wide, flat or folded, firm, scaberulous abaxially, often involute near the apex, scabrous and shortly pubescent adaxially. Panicles 15-50 cm long, (0.6)1–2(3) cm wide, loosely contracted, often purplish-tinged; primary branches 0.5-7 cm long, appressed or strongly ascending, rarely spreading as much as 20° from the rachises; pedicels 0.5-1.2 mm long, scabrous. Spikelets 2.4-3.5 mm long, light grayish; glumes 2-3.5 mm long, equal, longer than the florets, scabrous or smooth, 1-veined, obtuse to acute, occasionally bifid and the teeth to 0.3 mm long, awnless, rarely mucronate, mucros less than 0.2 mm long; lemmas 2.4-3.5 mm long, lanceolate, scabrous or smooth, rarely puberulent near the base, apex obtuse to acute, awned or unawned, the awns 1-4 mm long, straight; paleas 2.4-3.5 mm long, lanceolate, glabrous to puberulent between the veins on the proximal ¼, apex obtuse; anthers 1.1–1.5 mm long, purplish. Caryopsis 1.2–1.6 mm long, fusiform, reddish-brown. 2n = 20, 26, 30.

DISTRIBUTION AND HABITAT. Muhlenbergia lindheimeri grows in sandy draws or rocky, calcareous soils, generally in open areas, at elevations of 150–700 m. It is an uncommon species throughout its range, which includes northern Mexico and southern Texas.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Madera: Ciénega Ojo de la Víbora, ejido El Largo, bosque de pino-encino [pine-oak forest], 2300 m, *A. Benítez 2866*, 2867 (CIIDIR; MEXU); Puerto del Tenedor, ejido El Largo, bosque de pino-encino, 2450 m, *A. Benítez 2918* (CIIDIR).

235. Muhlenbergia longiligula Hitchc., Amer. J. Bot. 21(3): 136. 1934.

FIGURE 162F-I

Densely caespitose perennial. Culms 60–130 cm tall, robust, erect. Sheaths rounded, rarely compressed, but never keeled, glabrous to scabrous; ligule 20-30 mm long, firm, brown on the base, widely decurrent, membranous at the apex; blades 20-65 cm long, 3-6 mm wide, flat or enrolled on margins, glabrous to scabrous, green changing to brown, firm, involute when mature. Panicle 15–55 cm long, 1–15 cm wide, green to purple; branches 3-13 cm long, ascending or divergent, flowering to the base; pedicels 0.1-2.5 mm long, shorter than florets, glabrous to scabrous. Spikelets 2-3.5 mm long; glumes 2-3.5 mm long, longer than the lemma, occasionally shorter, equal or the upper a little longer than the lower, scabrous or glabrous, 1-veined, acute to acuminate, awnless, sometimes decurrent in a small awn; lemma 2-2.9 mm long, oblong-elliptic, green to purple, scabrous or glabrous, apex acute, often bifid, teeth to 0.2 mm long, awnless or rarely with a small awn of 2 mm; palea 2-3 mm long, a little longer than the lemma, glabrous, oblong-elliptic, scabrous to glabrous, acute; anthers 1-2 mm long, yellow to purple. Caryopsis 1.1–1.5 mm long, fusiform, brown-reddish. 2n = 22, 24, 29, 30.

DISTRIBUTION AND HABITAT. Muhlenbergia longiligula grows in pine or oak forests at elevations of 1,000–2,200 m. It occurs from the United States to Mexico in Chihuahua, Durango, Jalisco, Puebla, and Sonora.

This species is very similar to *Muhlenbergia emersleyi* but differs in having rounded basal sheaths, glabrous lemmas, and panicle branches flowered to the base. It is also similar to *M. lindheimeri* but differs in having rounded basal sheaths.

236. *Muhlenbergia lucida* Swallen, J. Wash. Acad. Sci. 26(5): 208. 1936.

FIGURE 151F-I

Caespitose perennial. Culms(25)40–60 cm tall, erect, with short, appressed hairs. Sheaths glabrous to pubescent or scabrous, apex puberulent; ligules 3–6(7) mm long, firm to base, apex obtuse, margins entire, decurrent, and with auricles; blades 15–30 cm long, 0.8–1.2 mm wide, firm, involute, flexuous, scabrous. Panicles 12–18 cm long, 6–12 cm wide, included to exserted, open, loosely flowered; branches 5–6 cm long, 1–2

per node, divergent, filiform, flexuous, scabrous or pubescent, naked below, spikelets distant at the end of the branches; pedicels 5–8 mm long, filiform, flexuous. Spikelets 3.8–4.2 mm long, green pale changing to whitish when mature; glumes 2.8–3.8 mm long, subequal, widely oblong-lanceolate, hyaline, veins inconspicuous, short-pubescent over the veins to the base; lower glumes 2.8–3.3 mm long; upper glumes 3.5–3.8 mm; lemmas 3.8–4.2 mm long, hyaline, densely villous, widely ovatelanceolate, apex bifid, teeth subacute, the teeth about 1 mm long, central vein prominent, reddish, turning into an awn, the awn 10–12 mm long, somewhat geniculate and twisted in the inferior part; paleas 3.8–4.2 mm long, equal to the lemma but a little narrower; anthers 2.1–2.4 mm long, brown to purplish. Caryopsis 2.5–2.8 mm long, fusiform, brown.

DISTRIBUTION AND HABITAT. Muhlenbergia lucida occurs in pine-oak forests at elevations of 2,245–2,680 m. This Mexican endemic has been found in Chihuahua, Guanajuato, México, and Sonora.

237. *Muhlenbergia macroura* (Kunth) Hitchc., N. Amer. Fl. 17(6): 468. 1935.

Caespitose perennial. Culms 75-200 cm tall, erect, rounded near base, forming dense clumps of 100 culms or more and up to 1 m in diameter, pubescent below the nodes, internodes mostly glabrous. Sheaths 15-40 cm long, shorter than the internodes, glabrous to scaberulous, the basal persistent and keeled with age; ligules (5)8-40(50) mm long, strongly decurrent, spliting into broad auricles, membranous to chartaceous above, brownish, firm, the veins evident below and near margins, apex truncate to obtuse; blades 20-60 cm long, 2-5 mm wide, mostly flat and apically involute, scabrous above and below. Panicles(15)20-40 cm long, 5-12 mm wide, dense, spikelike, erect, exserted and surpassing the blades in height, greenish to greenish-gray; primary branches 0.1-1.2 cm long, ascending and tightly appressed, unexposed, imbricate; pedicels 0.1-1.7 mm long, shorter than the spikelets, scaberulous. Spikelets 3.4–5.6 mm long, erect, strongly laterally compressed, greenish-gray; glumes 3.4-5.6 mm long, linear-elliptic to linear-ovate, usually longer than the lemma, 1-veined, scabrous along the keel, subequal, awnless, the upper slightly longer, apex acute to acuminate, scabrous; lemmas 3.4-5 mm long, elliptic to linear-elliptic, scabrous, greenishgray; callus pilose, the hairs 0.1-0.3 mm long, apex acute, rarely mucronate, the mucro less than 0.4 mm long; paleas 3.4–5 mm long, about as long as the lemma, scabrous, apex acute; anthers 1.5-2.2 mm long, dark greenish. Caryopsis 2-3 mm long, fusiform, brownish. 2n = 20, 24, 28.

DISTRIBUTION AND HABITAT. Muhlenbergia macroura occurs in the Sierra Madre Occidental in northern Mexico from Chihuahua to Chiapas, Guatemala, and Costa Rica; it is

found on upland slopes, in mountain meadows, and in pine or pine-oak forests often in deep humid soils at 1,500-3,400 m.

MEXICO. Chihuahua. SPECIMENS EXAMINED. Bocovna: Gonogochic region in Ejido San Ignacio Ararenco, Bye 5480 (US). 238. *Muhlenbergia majalcensis* P. M. Peterson, Syst. Bot. 14(3): 316–318, f. 1. 1989.

FIGURE 161A-D

Caespitose delicate annual. Culms 15-36 cm tall, erect, reddish, scabrous, strigulous below the nodes. Sheaths 10-32 mm long, shorter than the internode, glabrous to scaberulous, margins hyaline; ligules 1.5-2.0 mm long, hyaline, apex dentate to lacerate, obtuse to rounded, decurrent and extended above to form auricles; blades 2-10 cm long, 0.7-1.4 mm wide, flat to involute, midvein prominent, short-pubescent above and scaberulous below. Panicles 9-15 cm long, 3.5-9.5 cm wide, branches 1-6 cm long, 1-3 per node, ascending to open, capillary; pedicels 3-8 mm long, slender, capillary, curved and reflexed; spikelets at the end of branches, reddish when immature; glumes 1.2–1.5 mm long, equal and longer than the lemma, acuminate, glabrous, faintly 1-veined; lemma 1-1.2 mm long, oval, glabrous, straw color, awnless, apex rounded or obtuse; palea 1–1.2 mm long, oval, glabrous, apex rounded or obtuse; anthers 0.4-0.5 mm long, purplish. Carvopsis 0.8-0.9 mm long, ellipsoid, reddish-brown.

DISTRIBUTION AND HABITAT. Muhlenbergia majalcensis occurs in gravelly soils in pinyon–juniper forests at elevations of 2,140–2,200 m. This species is endemic to the Sierra Madre Occidental, known only from Chihuahua (Peterson, 1989).

This species is superficially similar to *M. annua* but differs in having a glabrous lemma and palea, spikelets with curved to reflexed pedicels, and plants 18–36 cm tall in *M. majalcensis* and 8–22 cm tall in *M. annua*. *Muhlenbergia majalcensis* is also similar to *M. capillipes* and can be separated from the latter in having glumes that are longer than lemma and palea, and anthers and caryopses shorter than those found in *M. capillipes*.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: 32 km W of Hwy 45 towards Benito Juárez, 2110 m, *P.M. Peterson & Annable 12550* (US). Riva Palacio: 20 mi W of

239. Muhlenbergia microsperma (DC.) Kunth, Révis. Gramin. 1: 64. 1829.

FIGURE 167A-D

Caespitose annual; rarely appearing as short-lived perennial. Culms 10-80 cm tall, often geniculate at the base, slender, often striate, very branched near the base, scaberulous below the nodes; internodes 1.8-8.6 mm long, mostly scaberulous or smooth. Sheaths 2.2-6.6 mm long, commonly shorter than the internodes, glabrous, smooth or scaberulous; ligules 1-2 mm long, membranous to hyaline, decurrent, margins often extended, apex truncate to obtuse; blades 3-8.5(10) cm long, 1-2.5 mm wide, flat or loosely involute, scabrous below, strigulose above, often deciduous with age. Panicles 6.5-13.5 cm long, 1-6.5 cm wide, open and not densely flowered, often purplish; primary branches 1.6-4 cm long, ascending or diverging to 80° from the rachises, spikelet-bearing to the base; pedicels 2-6 mm long, appressed to divaricate, antrorsely scabrous. Cleistogamous panicles with 1-3 spikelets present in the axils of the lower sheaths. Spikelets 2.5-5.5 mm long; glumes 0.4-1.3 mm long, exceeded by the florets, unequal, 1-veined, apex obtuse, often minutely erose; lower glumes 0.4–1 mm long; upper glumes 0.6–1.3 mm long; lemmas 2.5-3.8(5.3) mm long, narrowly lanceolate, mostly smooth, scaberulous distally, hairy on the callus, lower ½ of the margins, and midveins, with hairs 0.2-0.5 mm long, apex acuminate, awned, the awns 10-30 mm long, straight to flexuous; paleas 2.2-4.8 mm long, narrowly lanceolate, acuminate; anthers 0.3–1.2 mm long, purplish. Caryopsis 1.7-2.5 mm long, fusiform, reddishbrown. 2n = 20, 40, 60.

DISTRIBUTION AND HABITAT. Muhlenbergia microsperma grows on sandy slopes, drainages, cliffs, rock outcrops, and disturbed roadsides, at elevations of up to 0–2,400 m. It is usually found in creosote scrub and oak–pinyon woodland associations. Its range extends from the southwestrn United States and Mexico in Aguascalientes, Baja California, Baja California Sur, Chiapas, Chihuahua, Durango, Guanajuato, Guerrero, Hidalgo, Jalisco, México, Michoacán, Morelos, Nayarit, Oaxaca, Querétero, Sinaloa, Sonora, Tlaxcala, Veracruz, and Zacatecas through Central and South America along the Andes.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chinipas: Sierra Milpillas, 24.1 mi E of Los Tanques on road to Milpillas, pinyon woodlands, 2100 m, *P.M. Peterson & Annable 4169* (ENCB, US). Guachochi: 6.3 mi S of Cusarare on road to Guachochi, 2420 m, *P.M. Peterson & Annable 5888* (US);

Parque Nacional Barranca del Cobre, 0.5 km E of La Bufa at the bridge crossing the Río Batopilas, 1000 m, *P.M. Peterson, Annable & Valdés-Reyna 10842* (US). Moris: South-western Chihuahua, 2200 m, *E. Palmer 158* (TAES. US), type; Río Bonito, *Le Saueur 156* (US).

240. Muhlenbergia minutissima (Steud.) Swallen, Contr. U.S. Natl. Herb. 29(4): 207. 1947.

FIGURE 168

Delicate annual. Culms 5-40 cm tall, slender, erect or spreading; scaberulous or strigulose below the nodes; internodes mostly glabrous, scaberulous or smooth. Sheaths 0.4-5.2 cm long, shorter or longer than the internodes, smooth or scaberulous; ligules 1-2.6 mm long, hyaline, margins entire, rarely with lateral lobes or auricles not longer than the body of the ligule, apex truncate to obtuse; blades 0.5-4(10) cm long, 0.8-2 mm wide, flat or involute, scabrous below, puberulent above, margins and midveins not whitish-thickened. Panicles 5-16.2(21) cm long, 1.5-6.5 cm wide, open; primary branches 8-42 mm long, often capillary, diverging 25°-80° from the rachises; pedicels 2-7 mm long, straight or curved, but rarely curved as much as 90°; glumes 0.5-0.9 mm long, subequal, sparsely strigulose, at least near the apex, the hairs 0.1-0.3 mm long, 1-veined; lower glumes 0.5-0.8 mm long, obtuse to acute; upper glumes 0.6-0.9 mm long, broader than the lower glumes, obtuse; lemmas 0.8-1.5 mm long, lanceolate, brownish to purplish, glabrous or the midveins and margins appressed-pubescent, apex obtuse to subacute, awnless; paleas 0.8-1.4 mm long, puberulent or glabrous; anthers 0.2-0.7 mm long, purplish. Caryopsis 0.6-0.9 mm long, fusiform to elliptic, brownish. 2n = 60, 80.

DISTRIBUTION AND HABITAT. *Muhlenbergia minutissima* grows in sandy and gravelly drainages, rocky slopes, flats, road cuts, and open sites. It is usually found in yellow pine and oak–pine forests, pinyon–juniper woodlands, thorn scrub forests, and oak–grama savannahs at elevations of 1,200–3,000 m. It occurs in western North America to southern Texas and throughout Mexico to Guatemala.

241. *Muhlenbergia montana* (Nutt.) Hitchc., U.S.D.A. Bull. (1915–23) 772: 145, 147. 1920.

FIGURE 169

Densely caespitose perennial. Culms 10-80 cm tall, erect, rounded near base, glabrous below the strictly basal nodes; internodes mostly glabrous, occasionally glaucous. Sheaths 2-35 cm long, longer than the lower internode, glabrous to scaberulous, often glaucous, becoming flat, loose and papery, and occasionally spirally twisted near the base; ligules 4-14(20) mm long, membranous, decurrent, apex acute to acuminate, often lacerate; blades 6-25 cm long, 1-2.5 mm wide, flat becoming loosely involute to subfiliform, somewhat stiff, scabrous below and hirsute above. Panicles 5-25 cm long, (1)2-6 cm wide, narrow to somewhat open, loosely flowered, not dense; primary branches 0.5-10 cm long, ascending, appressed or spreading to 40° from the rachises; pedicels 0.5-6.5 mm long, flattened, scabrous, occasionally stiffly reflexed. Spikelets 3-4.5(7) mm long, erect, occasionally reflexed; glumes (1)1.5-3.2(4) mm long, 1/3 to 1/3 as long as the lemma, subequal, glabrous to scaberulous above; lower glumes 1-veined, sometimes mucronate, the mucro less than 1 mm long; upper glumes 3-veined, 3-toothed and 3-awned, the teeth (including the awns) 1/3 to 1/2 the length of the glume, and the awns up to 1.7 mm long, apex truncate to acute; lemmas 3-4.5(7) mm long, lanceolate, awned, often greenish or yellowish with dark green or purple mottles, scaberulous above, loosely to densely appressed-pubescent to pilose along the midvein, margins, and proximal ½ to ½, the hairs up to 0.8 mm long, occasionally glabrous, apex acute to acuminate, the awn (2)6-25 mm long, flexuous; paleas 3-4.5(7) mm long, lanceolate, loosely to densely appressed-pubescent to pilose between the veins on the proximal 1/3 to 1/5, apex acute to acuminate, scaberulous; anthers 1.5–2.3 mm long, purplish. Caryopsis 1.8–2 mm long, fusiform, light brown. 2n = 20, 40.

DISTRIBUTION AND HABITAT. *Muhlenbergia montana* grows on rocky slopes, dry meadows, ridgetops, and open grasslands, primarily in upland and mountain habitats at elevations of 1,400–3,500 m. It ranges from the southwestern United States throughout western Mexico to Guatemala.

242. *Muhlenbergia mucronata* (Kunth) Trin., Gram. Unifl. Sesquifl. 194, t. 5, f. 23. 1824.

Muhlenbergia laxiflora Scribn.

FIGURE 170H

Densely caespitose perennial. Culms 75–100(120) cm tall, erect, scabrous or strigulous below the nodes. Sheaths shorter than internodes, glabrous or scaberulous, purplish in part, rounded below; ligules (2)5–8 mm long; blades 20–40 cm long, 2–3 mm wide, flat or loosely involute, attenuate into a long apex, scabrous abaxially, scabrous on ribs adaxially. Panicle (5)10–15(20) cm long, 1–3(6) cm wide, oblong-cylindrical, spreading, purple, rarely purple-greenish, branches 4–8(10) cm long, ascending or appressed. Spikelets (4)4.5–5 mm long, pedicels 1–5(6) mm long, slender, scabrous below spikelets; glumes 1.5–2 mm long, acute, subequal, scabrous near the apex; lemma (4)4.5–5 mm

long, scaberulous between veins, mucronate or shortly awned from 2 minute teeth, the mucro or awn 0.5–1(2) mm long; palea scabrous between the veins, apex acute or acuminate; callus hairy, the hairs 0.5–0.7 mm long; anthers 2–2.2 mm long, purplish. Caryopsis 2–2.5 mm long, about 0.5 mm wide, ellipsoid, reddish-brown.

DISTRIBUTION AND HABITAT. Muhlenbergia mucronata grows in oak and pine forests at elevations of 2,050–2,650 m. This Mexican endemic is known from Baja California, Chiapas, Chihuahua, Distrito Federal, Durango, Guanajuato, Mexico City, Oaxaca, Puebla, San Luis Potosí, Sinaloa, Veracruz, and Zacatecas.

Muhlenbergia mucronata is morphologically similar to *M. rigida*, differing in the mucronate to short-awned lemmas, narrower panicles, and usually shorter pedicels.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 19.3 km SE of Balleza towards Parral, 26 Sep 1988, 1800 m, P.M. Peterson & Annable 5946 (US); 34 mi W of Balleza towards Guachochi, 2500, P.M. FIGURE 159A-E

Perennial; densely caespitose. Culms $35-100\,\mathrm{cm}$ tall, erect, glabrous. Sheaths rounded, glabrous to scabrous; ligule $1-3\,\mathrm{mm}$

long, firm, truncate, membranous, minutely ciliolate; blades 15–50 cm long, 1–3.5 mm wide, flat or involute, glabrous or scabrous. Panicles 15–35 cm long, 0.5–2(3) cm wide, dense to loosely flowered, narrow, straight, rachis scabrous, branches 0.5–8 cm long, plicated, flowered from the base; pedicels 1–6 mm long, hispid. Spikelets 3–4.3 mm long, brown-yellowish to purplish;

glumes (1.7) 2–3.1 mm long, subequal, 1-veined, apex acute to acuminate, awned, the awn 1.2–1.5 mm long, finely scabrous distally; lemmas 3–4.3 mm long, scabrous, lanceolate, apex acuminate, awned, the awns 5–10 mm long, straight, sometimes flexuous; palea 2.9–4.2 mm long, lanceolate, scabrous, apex acute to acuminate; anthers 1.5–2.5 mm long, yellow or spotted with purple. Caryopsis 2–3 mm long, fusiform, brown.

DISTRIBUTION AND HABITAT. Muhlenbergia palmeri grows on rocky and sandy soils in oak and pine forests at elevations of 1,580–2,100 m. It ranges from the United States to Mexico in Chihuahua, Michoacán, and Sonora.

245. *Muhlenbergia pectinata* C. O. Goodd., J. Wash. Acad. Sci. 31(12): 505–506. 1941.

Annual; slender, delicate. Culms 10–35 cm tall, glabrous, filiform, erect or decumbent, branched. Sheaths glabrous, striate, margins sparsely pilose; ligules 0.3–0.9 mm long, hyaline, pilose; blades 1–6 cm long, 0.6–2 mm wide, flat to involute, appressed, sparsely pilose. Panicles 4–12 cm long, 0.5–2.6(4) cm wide, included or exserted in the upper sheath, terminal; branches 2–3.5 cm long, ascending; pedicels 1–3 mm long, glabrous, appressed. Spikelets ascending or straight, overlapping, green with purple spots; glumes 0.8–2(3) mm long, subequal, awned or awnless, glabrous, 1-veined, apex acute or acuminate, awn to 1.5 mm long, lower glumes 0.8–1.7 mm long, upper glumes 1–2(3) mm; lemmas 3–4.5(5) mm long, subulate to lanceolate,

awn 10–30 mm long, slender, flexuous, glabrous to antrorsely scabrous, appearing 5-veined, veins greenish, lateral ones occasionally ciliate, the hairs flattened, swollen at the base; paleas 2.5-4.5 mm long, narrowly lanceolate, glabrous, acuminate; anthers 0.3-0.6 mm long, yellowish. Caryopsis 0.6-3.1 mm long, narrowly fusiform, light brown. n=10.

DISTRIBUTION AND HABITAT. *Muhlenbergia pectinata* grows in oak and pine forests at elevations of 1,750–2,000 m. It ranges from the United States to Mexico in Chihuahua, Durango, Guerrero, Jalisco, México, Michoacán, Morelos, Nayarit, Oaxaca, Sinaloa, and Sonora.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: La Bufa, 21 mi S of Mex 127 on rd to Batopilas, 1750 m, P.M. Peterson, Annable & Y. Herrera 8057 (US). Batopilas, E. Palmer (US). FIGURE 167E-J

Delicate, caespitose annual. Culms 15-90 cm tall, decumbent, rooting from lower nodes. Sheaths with oral hairs ciliate, auricles 1-1.5 mm long, falcate; ligules 0.5-1 mm long, membranous, eciliate, irregularly erose; blades 5-15 cm long, 2-3 mm wide, flat, acuminate. Panicles 5-20 cm long, 2-3 cm wide, spiciform, linear, continuous or interrupted; branches 0.5-3.5 cm long, appressed. Spikelets with 1 or 2 perfect spikelets and 2 or 3 sterile spikelets (bristles) in a cluster, the fertile spikelets subtended by an involucre of persistent bristles, the bristles 3 mm long; glumes about 1 mm long, equal, awned, the awns 1.8-2 mm long; fertile florets 1.5-2.6 mm long, lanceolate, laterally compressed, disarticulating below without rachilla extension; lemmas 1.5-2.6 mm long, ovate, keeled, 3-veined, lateral veins close to margins, scabrous, apex acuminate, awned, the awns 20-30 mm long, callus hairy, the hairs 0.3-1 mm long; palea similar to lemma; anthers 3, 0.5-0.7 mm long, yellow. Caryopsis 0.8 mm long, ellipsoid, with adherent pericarp, 2n = 20.

DISTRIBUTION AND HABITAT. *Muhlenbergia* pereilema grows in tropical and oak–pine forests at elevations of 1,240–2,450 m. It ranges from throughout Mexico to Central and South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chinipas: Sierra Saguarivo, 1.3 mi W of Curahui, 9 Sep 2008, tropical deciduous forest, 1001 m, *P.M. Peterson & J.M. Saarela* 22147 (US). 248. *Muhlenbergia phalaroides* (Kunth) P. M. Peterson, Caldasia 31(2): 294–296, f. 7A,B. 2009. *Lycurus phalaroides* Kunth, Nov. Gen. Sp. (quarto ed.) 1: 142. 1815 [1816].

Caespitose perennial. Culms 10–40 cm tall, erect or decumbent, nodes and internodes scabrous. Sheaths sparsely puberulent near margins, compressed-keeled near the base; ligules 0.5–1 mm long, apex truncate; blades 1–6 cm long, 0.3–0.7 mm wide, glabrous to sparsely puberulent, apically navicular to short-acute, margins and midvein not whitish-thickened. Panicles 1–6.5 cm long, 3–5 mm wide, narrow, contracted, spikelike, densely flowered; branches tightly appressed. Spikelets 3–4 mm long, 1-flowered, often paired, the upper perfect, the lower staminate or sterile; lower glumes 0.8–2 mm long, usually 2-veined, rarely 1-veined, usually 2-awned, rarely 1-awned, the awns 0.7–2.5 mm long; upper glumes 1–2 mm long, awn 1–3 mm long; lemmas 3–4 mm long, awned, the awn 1–2.9 mm long, scabrous; anthers 1.5–2.1 mm long. Caryopsis 1.8–2 mm long.

DISTRIBUTION AND HABITAT. Muhlenbergia phalaroides grows in grasslands, xerophilous scrublands, and pine–oak forests at elevations of 2,218–2,535 m. It ranges from the United States and Mexico in Aguascalientes, Baja California Sur, Chiapas, Chihuahua, Coahuila, Colima, Distrito Federal, Durango, Guanajuato, Hidalgo, Jalisco, México, Michoacán, Morelos, Nayarit, Nuevo León, Oaxaca, Puebla, Querétaro, San Luis Potosí, Tamaulipas, Tlaxcala, Veracruz, and Zacatecas to Central and South America.

FIGURE 172

Loosely caespitose perennial. Culms 20-60 cm tall, erect to decumbent at the base, scabrous to puberulent just above or below the nodes. Sheaths usually 0.5-3 cm long, glabrous to pubescent, compressed-keeled near the base; ligules 2-3 mm long, acuminate and erose, usually auriculate with triangular lateral lobes 0.5-2.5 mm long, decurrent below; blades 2-8 cm long, 1-1.5 mm wide, flat or folded, glabrous to puberulent adaxially and puberulent to hirsute abaxially, margins and midvein whitish-thickened, apex acute or sometimes with a narrow bristle 0.5-3 mm on the upper blades. Panicles (2)4-10 cm long, 4-8 mm wide, narrow, contracted, densely flowered, and spikelike; primary branches 0.1-0.3 cm long, tightly appressed. Spikelets 3-4 mm long, 1-flowered, often paired, the upper perfect, the lower staminate or sterile; glumes 1-2 mm long, scaberulous near apex, awned, the awns 1-5 mm long; lower glumes usually 2(3)-veined and 2-awned; upper glumes 1(2)-veined, the

awns 2–5 mm long; lemmas 3–4 mm long, puberulent along the margins, awned, the awns 1–3 mm long; paleas 3–4 mm long, puberulent between the veins; anthers 1.5–2 mm long, yellow. Caryopsis 1.8–2.2 mm long, brownish. 2n = 40.

DISTRIBUTION AND HABITAT. Muhlenbergia phleoides grows on rocky slopes, in canyons, and on flats, often occurring in calcareous soils and oak-pinyon-juniper woodlands associated with Quercus gregii and Larrea tridentata at elevations of 1,200–2,500 m. It extends from the southwestern United States in Texas and New Mexico to northern and central Mexico in Aguascalientes, Chihuahua, Distrito Federal, Durango, Guanajuato, Hidalgo, Jalisco, México, Michoacán, Morelos, Nayarit, Oaxaca, Puebla, Querétaro, San Luis Potosí, Sonora, Tlaxcala, and Zacatecas.

250. Muhlenbergia polycaulis Scribn., Bull. Torrey Bot. Club 38: 327. 1911.

FIGURE 166E-I

Loosely caespitose perennial; from a firm, knotty, short rhizomatous base. Culms 15–40(50) cm tall, erect, decumbent at the base, often geniculate, strigulose below the nodes; internodes strigulose to glabrous. Sheaths 1–8 cm long, mostly shorter than the internodes, glabrous to scaberulous, not becoming spirally coiled when old; ligules 0.5–2.5 mm long, erose or lacerate, apex obtuse to acute, margins hyaline, firmer than the central portion; blades 3–10 mm long, 0.5–2 mm wide, flat or involute, occasionally folded, hirsute or scaberulous adaxially and scaberulous or smooth abaxially. Panicles 2–12 cm long, (0.6)1–2 cm wide, narrow, contracted and interrupted below; branches 0.5–4 cm long, ascending and appressed occasionally spreading to 30° from the rachises, spikelet bearing to the base; pedicels 0.1–1.5 mm

long, scabrous. Spikelets 2–3.5 mm long, plump near the middle; glumes (1)1.5–2.6 mm long, more than ½ as long as the lemma, subequal, 1-veined, mucronate, awned or awnless, scabrous along midvein near the apex, apex acute sometimes acuminate, the awn to 1.4 mm long; lemmas 2–3.5 mm long, elliptic, widest near the middle, appressed-pubescent along the midvein and margins on the proximal ½ to ¾, the hairs up to 0.5 mm long, apex acuminate, scaberulous, awned, the awn 10–20(25) mm long, flexuous; paleas 2–3.5 mm long, elliptic, appressed-pubescent between the veins on the proximal ½, apex acuminate; anthers 1.5–2 mm long, orange. Caryopsis 1.5–2 mm long, fusiform, brownish. 2n = 20, 40.

DISTRIBUTION AND HABITAT. Muhlenbergia polycaulis grows on steep rocky slopes, canyon walls, cliffs, table rocks, and volcanic rock outcrops in open vegetation associated with Quercus spp. and Pinus spp. at 1,200–2,410 m. It occurs in southeastern Arizona, southern New Mexico, southwestern Texas, and Mexico in Aguascalientes, Baja California, Baja California Sur, Chihuahua, Durango, Guanajuato, Hidalgo, Jalisco, México, Nayarit, Querétaro, San Luis Potosí, Sinaloa, Sonora, and Zacatecas.

251. *Muhlenbergia porteri* Scribn. ex Beal, Grass. N. Amer. 2: 259. 1896.

FIGURE 173

Loosely caespitose perennial; with a wiry and knotty base, rhizomes absent, distinctly bushy in appearance. Culms 25–100 cm tall, 0.5–1.5 mm thick near base, erect, geniculate and widely spreading near base, freely branched, branching at the lower and middle nodes; scaberulous below the nodes; internodes mostly scaberulous. Sheaths 0.7-4 cm long, shorter than the internodes, glabrous; ligules 1-2.5(4) mm long, toothed or lacerate, apex truncate, margins hyaline, decurrent, sometimes extended to form short auricles; blades 2-8 cm long, 0.5-2 mm wide, flat or folded, scaberulous adaxially and smooth to scaberulous abaxially. Panicles 4-14 cm long, 6-15 cm wide, open, loosely flowered, usually purple; branches 1-7.5 cm long, widely divergent and stiffly spreading 30°-90° from the rachises, not floriferous basally; pedicels 2-13(20) mm long, scabrous. Spikelets 3-4.5 mm long, often purple; glumes 2-3 mm long, subequal, 1-veined, occasionally mucronate, scabrous along the vein, apex acuminate, occasionally mucronate, the mucro to 0.4 mm long; lemmas 3-4.5 mm long, lanceolate, purplish, appressedpubescent on the margins and midvein on the proximal ½ to ¾, apex acuminate, awned, the awn 5-13 mm long, straight; paleas 3-4.5 mm long, lanceolate, glabrous or appressed-pubescent between the veins on the proximal 45, apex acuminate; anthers 1.5–2.3 mm long, purple to yellow. Caryopsis 2–2.4 mm long, ellipsoid, compressed, yellowish-brown. 2n = 20, 23, 24, 40.

DISTRIBUTION AND HABITAT. Muhlenbergia porteri grows on rocky slopes among dry streams, desert flats, grasslands, and scrublands, frequently in the protection of shrubs associated with *Prosopis* spp. and *Larrea tridentata* at 600–1,700 m. It occurs in southeastern California, southern Nevada, southern Utah, Arizona, southern New Mexico, and western Texas to Mexico in Baja California, Chihuahua, Durango, San Luis Potosí, Sonora, and Zacatecas.

252. *Muhlenbergia pubescens* (Kunth) Hitchc., N. Amer. Fl. 17(6): 460. 1935.

Densely caspitose perennial. Culms 1–1.5 m tall, erect, sparsely to densely pilose, especially near base. Sheaths basal, compressed-keeled and flattened, villous, lacking auricles; ligules 2–4 mm long, membranous, lacerate; blades 25–50 cm long, 2.5–6 mm wide, flat, villous. Panicles 20–40(50) cm long, 2–7 cm wide, erect, columnar, densely flowered, gray to gray-purplish. Spikelets 2.5–3 mm long; glumes 2.5–3 mm long, longer than florets, sparsely to densely villous, widely acute in the apex, subequal or lower glume 1–2 mm shorter than the upper glume; lemmas 2.2–2.6 mm long, villous, awned, the awn 5–10 mm long; anthers 0.8–1.2 mm long, yellow to purplish. Caryopsis 1.2–1.5 mm long, ellipsoid to ovoid, light brown.

DISTRIBUTION AND HABITAT. Muhlenbergia pubescens occurs in grasslands, pine–oak–juniper forests at elevations of 1,700–2,000 m. In Mexico it occurs in Aguascalientes, Chihuahua, Distrito Federal, Durango, Guanajuato, Hidalgo, Jalisco, México, Michoacán, Nayarit, Oaxaca, Puebla, San Luis Potosí, Tlaxcala, and Zacatecas.

253. *Muhlenbergia pubigluma* Swallen, Proc. Biol. Soc. Wash. 56: 78. 1943.

Densely caespitose perennial. Culms (50)65-125 cm tall, stout, erect, puberulent below the nodes, 2 or 3 nodes per culm; internodes glabrous. Sheaths 10-32 cm long, usually longer than the internodes, scaberulous, basal sheaths compressed-keeled, glabrous, dark brown with the age; ligules 5-13 mm long, membranous above and firm and brown below, decurrent; blades 10-35 cm long, 1.5-3 mm wide, folded to involute, attenuate, firm, scabrous with whitish pubescence, the short hairs about 0.1 mm long, these slightly longer on the upper surface and near the collar. Panicles (15)20-34 cm long, 1-3 cm wide, narrow, loosely contracted; primary branches 1-6 cm long, mostly ascending and appressed, rarely spreading to 20° from the rachises, grayish-green; pedicels 0.3-2.5 mm long, usually shorter than the spikelets, scabrous. Spikelets 2.5-3.5 mm long; glumes 2–3.3 mm long, usually shorter than the floret, 1-veined, lightly pubescent especially near the base, apex obtuse to acute, awnless; lemmas 2.8-3.5 mm long, lanceolate, grayish-green to purplish, the lateral veins indistinct, appressed villous on the lower ½, basal margins densely villous, the hairs less than 0.5 mm long, apex acute, usually short-awned, the awns 0.5-3.5 mm long; paleas 2.7–3 mm long, pubescent between the veins on the proximal 1/3, apex obtuse; anthers 1.4–1.6 mm long, yellowish.

DISTRIBUTION AND HABITAT. Muhlenbergia pubigluma is endemic to Mexico and has been reported in Chihuahua, Coahuila, Nuevo León, and Tamaulipas (Valdés Reyna, 2015). Muhlenbergia pubigluma primarily occurs on calcareous slopes and flats within oak–pinyon–juniper woodlands at 1,800–3,400 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

254. *Muhlenbergia purpusii* Mez, Repert. Spec. Nov. Regni Veg. 17(13–18): 214. 1921.

Caespitose perennial. Culms 25–60 cm tall, erect, pubescent below the nodes, the nodes all basal, terete, usually 1 node

per culm; internodes scabrous and pubescent. Sheaths 1-20 cm long, shorter than the internodes, pubescent to hirsute, sheaths rounded, brownish with age below; ligules 4-10 mm long, membranous above and firm and brownish below, decurrent, margins puberulent and wider than ½ the adjacent blade width, apex acuminate; blades 5-13 cm long, 0.7-1.8 mm wide, flat or folded, falcate, puberulent to hirsute above and below, the hairs about 0.1 mm long, margins scabrous. Panicles 7–25(30) cm long, 1-10 cm wide, loosely contracted to open, ovate to pyramidal, purplish; primary branches 2–8.5 cm long, capillary, ascending, appressed or spreading to 50° from the rachises; pedicels (2)4-14 mm long, mostly longer than the spikelets, flexuous, glabrous and smooth. Spikelets 2.4–3.2 mm long, purplish; glumes 0.7-1.1 mm long, less than ½ as long as the lemma, obscurely 1-veined, puberulent on upper \(\frac{2}{3} \), apex obtuse to acute often erose; lemmas 2.3–3.1 mm long, lanceolate, purplish, short pilose, the hairs 0.1–0.2 mm long, callus short pilose, apex acute, entire to minutely bifid, awned, the awn 10-20 mm long, flexuous; paleas 2.4-3.2 mm long, slightly longer than the lemma, short pilose between the veins, apex acute; anthers 1.6-2 mm long, purplish. Caryopsis 1-1.2 mm long, fusiform to ovoid, brownish. 2n = 20.

DISTRIBUTION AND HABITAT. Muhlenbergia purpusii occurs on calcareous-derived soils primarily on gypsum flats, usually on the sides of sink holes, rock outcrops, roadsides, and slopes with pinyon–juniper woodlands at 1,240–1,900 m. This species is reported in Chihuahua, Coahuila, and San Luis Potosí.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000).

255. Muhlenbergia quadridentata (Kunth) Trin., Gram. Unifl. Sesquifl. 194, t. 5b, f. 14. 1824.

Densely tufted perennial. Culms 20-70 cm tall, erect, mostly glabrous below the basal nodes, flattened, 1 node per culm; internodes mostly scabrous. Sheaths 10-30 cm long, shorter than the internodes, scabrous to smooth; basal sheaths densely pubescent to glabrous abaxially, smooth and shiny adaxially, becoming flat and usually not spirally twisted with the age; ligules 2-8 mm long, membranous to hyaline above, firm and often brownish with evident veins near the margins below, decurrent, apex acuminate often lacerate; blades 5-15 cm long, 0.6-2 mm wide, flat or usually tightly involute, scaberulous below, short-spiculate and often villous above, the hairs 0.2-0.5 mm long, usually appressed, the spicules shiny to whitish. Panicles 5-20 cm long, 0.5-2 cm wide, narrow, loosely contracted, interrupted below, mostly plumbeous; primary branches 0.5-5(6) cm long, appressed and ascending to spreading to 30° from the rachises; central axis flattened with 2 ribs, scabrous; pedicels 0.5-2 mm long, shorter than the spikelets, scabrous. Spikelets 3.4-4.7 mm long, mostly plumbeous; glumes 1.8-4 mm long, shorter to almost as long as the floret, unequal, mostly greenish-plumbeous, scabrous, usually with few short hairs below; lower glumes 1.5-2.5(3) mm long, 1-veined, apex obtuse to acute, often with 2 small teeth; upper glumes (3)3.2-4 mm long, 3-veined, apex truncate, obtuse or acute, often with 3 or 4 small teeth, the teeth less than $\frac{1}{2}$ the length of the glumes; lemmas 3–4.7 mm long, lanceolate, terete, usually awned, greenish-plumbeous to mottled-plumbeous, sparsely pilose near base and margins on lower $\frac{1}{2}$, apex acuminate, scabrous, unawned, mucronate or with an awn 1–20 mm long, flexuous, scabrous, greenish-plumbeous; paleas 2.8–4.3 mm long, shorter than the lemma, pilose on the proximal $\frac{1}{2}$; anthers 1–2.5 mm long, purple. Caryopsis 1.8–2 mm long, fusiform, brownish. 2n = 20.

DISTRIBUTION AND HABITAT. Muhlenbergia quadridentata occurs on open to forested slopes derived from calcareous and volcanic rocks and is associated with *Pinus* spp., and *Quercus* spp. at (1,900)2,500–4,100 m; it occurs throughout Mexico in the higher mountains and also found in Guatemala.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guadalupe y Calvo: near Cumbre Mohinora, 13 Sep 2006, 3300 m, P.M. Peterson 20038, F. Sánchez Alvarado & E.P. Gómez Ruíz (CIIDIR, US).

256. Muhlenbergia ramulosa (Kunth) Swallen, Contr. U.S. Natl. Herb. 29(4): 205. 1947.

FIGURE 174

Annual; delicate, slender, often purplish. Culms (3)5–25 cm tall, erect or geniculate, branched at the base, glabrous. Sheaths glabrous or scabrous; ligules 0.2–0.5 mm long, hyaline, truncate, ciliate, without lateral lobes (auricles); blades 5–30 cm long, 0.8–1.2 mm wide, flat or involute, glabrous to puberulent. Panicles (1)2–9 cm long, 0.6–2.5 cm wide, ovoid, sparsely flowered; branches (0.5)1–3.2 cm long, ascending to spreading (open) or closely appressed; pedicels 1–3 mm long, glabrous or scabrous, rigid. Spikelets 0.8–1.3 mm long, erect; glumes 0.4–0.7 mm long, equal, 1-veined, glabrous, whitish, obtuse or subacute, awnless; lemmas 0.8–1.3 mm long, oval, with green spots, inflated at maturity, glabrous or appressed-pubescent on margins and midvein, apex acute, awnless; palea 0.7–1.3 mm long, oval; anthers 0.2–0.3 mm long, purplish; Caryopsis 0.5–1 mm long, ellipsoid, brownish to purplish. n = 10.

DISTRIBUTION AND HABITAT. Muhlenbergia ramulosa occurs in open pine-oak and tropical forests at elevations of 1,620–2,680 m. It ranges from the United States to throughout Mexico, Central America, and Argentina.

257. Muhlenbergia repens (J. Presl) Hitchc., Fl. Calif. 1: 111. 1912

FIGURE 175A-D

Perennial; with shining, creeping, scaly rhizomes. Culms 5–42 cm tall, decumbent near base, forming dense mats, freely branching above, glabrous below the nodes; internodes mostly glabrous below, lightly nodulose roughened just below the inflorescence. Sheaths 0.6–3.4 cm long, shorter or longer than the internodes, glabrous, margins hyaline; ligules 0.1–1(1.8) mm long, membranous, decurrent, apex truncate, occasionally

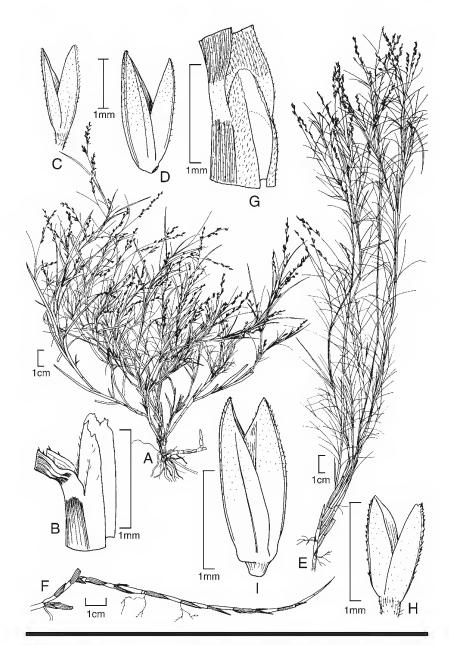

FIGURE 175. Muhlenbergia repens. A. Habit. B. Ligule. C. Glumes. D. Floret. Muhlenbergia utilis. E. Habit. F. Rhizome. G. Ligule. H. Glumes. I. Floret. Drawn by Cathy Pasquale for Smithsonian Institution, Department of Botany.

lacerate; blades 0.4–6 cm long, 0.5–1.4 mm wide, involute, somewhat arcuate-spreading, mostly glabrous below and scaberulous above. Panicles 1–9 cm long, 0.1–0.6 cm wide, narrow, contracted, loosely flowered, usually included at the base in the uppermost leaf sheath; primary branches 0.2–3 cm long, usually closely appressed, rarely diverging to 40° from the rachises;

pedicels 0.2–3.6 mm long, minutely setose. Spikelets 2.6–4.2 mm long, occasionally 2-flowered; glumes 1.1–3.6 mm long, ½ to as long as the lemma, subequal, usually 1-veined, occasionally 2- to 3-veined, light green, apex acute; lemmas 2.6–3.2(4.2)mm long, lanceolate, unawned or mucronate, dark greenish or mottled, glabrous or with minute appressed pubescence along the margin

and base, the hairs less than 0.1 mm long, apex acute to attenuate and tapering, scaberulous, the mucro 0.1–0.8 mm long; paleas 2.1–3.3 mm long, lanceolate, glabrous to scaberulous, apex acute; anthers 0.7–1.4 mm long, yellow to purplish. Caryopsis 1.1–1.5 mm long, ellipsoid to ovoid, brownish. 2n = 60, 70–72.

DISTRIBUTION AND HABITAT. Muhlenbergia repens occurs in sandy meadows, canyon bottoms, calcareous rocky flats, gypsum flats, rolling slopes, and roadsides associated with oak–pinyon–juniper woodlands at 100–3,120 m; it occurs in southern Utah, southern Colorado, eastern Arizona, New Mexico, and west Texas and throughout México.

258. Muhlenbergia richardsonis (Trin.) Rydb., Bull. Torrey Bot. Club 32(11): 600. 1905.

Perennial; rhizomatous, not caespitose, often mat-forming. Culms 5–30 cm tall, decumbent, geniculate, or erect; internodes usually nodulose (occasionally smooth) for most of their length, puberulent or nodulose below the nodes. Sheaths shorter or longer than the internodes, glabrous; ligules 0.8–3 mm long, membranous, acute to truncate, erose; blades 0.4–6.5 cm long, 0.5–4.2 mm wide, flat or involute, straight or arcuate-spreading, glabrous abaxially, hirtellous adaxially. Panicles 1–15 cm long, 0.1–1.7 cm wide, exserted, narrow or spikelike, rachises usually concealed by the branches; primary branches 0.4–5 cm long, usually closely appressed at maturity, rarely diverging up to 20° from the rachises; pedicels 0.2–2 mm long, setulose. Spikelets 1.7–3.1 mm long, occasionally with 2 florets. Glumes subequal, 0.6–2 mm long, ½–½ as long as the lemmas, green,

1(2)-veined, acute, sometimes mucronate, mucros less than 0.2 mm long; lemmas 1.7-2.6(3.1) mm long, lanceolate, dark greenish, plumbeous, or mottled, glabrous, apex scaberulous, acute to acuminate, sometimes mucronate, mucros to 0.5 mm long; paleas 1.2-2.4(2.9) mm long, lanceolate, acute; anthers 0.9-1.6 mm long, yellow to purplish. Caryopses 0.9-1.6 mm long, narrowly ellipsoid, brown. 2n = 40.

DISTRIBUTION AND HABITAT. *Muhlenbergia richardsonis* grows in open sites in alkaline meadows, prairies, sandy arroyo bottoms, talus slopes, rocky flats, and the shores of rivers. It occurs from the Yukon Territory to Quebec south to northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Cuauhtémoc: 10 mi W of Cuauhtemoc on Hwy 16, 5 Sep 1985, 2100 m, *P.M. Peterson & Annable* 4056, 4057 (US).

259. Muhlenbergia rigens (Benth.) Hitchc., J. Wash. Acad. Sci. 23: 453. 1933.

FIGURE 176

Densely caespitose perennial. Culms (35)50-150 cm tall, erect, rounded and up to 5 mm thick near base, mostly glabrous below the nodes; internodes glabrous. Sheaths 3-45 cm long, longer than the internodes, glabrous to scaberulous, rounded to keeled and chartaceous near base; ligules 0.5-2(3) mm long, somewhat firm, decurrent, apex truncate, usually minutely ciliolate; blades 10-50 cm long, 1.5-6 mm wide, flat or involute, stiff, glabrous abaxially and scabrous between the prominent ridges adaxially. Panicles 15-60 cm long, 0.5-1.2 cm wide, narrow, elongate, contracted and spikelike, densely flowered, often interrupted below, grayish-green; primary branches 0.2-4 cm long, ascending and tightly appressed; pedicels 0.2–3 mm long, mostly shorter than the spikelets, hirsute. Spikelets 2.4-4 mm long, erect, gravish-green; glumes 1.8–3.2 mm long, subequal, shorter than the lemma, scabrous to scaberulous, 1-veined, apex acute or obtuse, occasionally acuminate or notched, mucronate or short-awned, the awn to 1.7 mm long; lemmas 2.4-4 mm long, lanceolate, unawned, rarely mucronate, glabrous below and scabrous above, short appressed pubescence on the callus, midvein, and margins on the proximal 1/6, the hairs up to 0.4 mm long, apex acute or obtuse, the mucro to 0.9 mm long; paleas 2.3-3.8 mm long, lanceolate, glabrous below and scabrous above, apex mostly acute; anthers 1.3-1.8 mm long, yellow to purple. Caryopsis 1.8-2.2 mm long, fusiform, brownish. 2n = 40.

DISTRIBUTION AND HABITAT. Muhlenbergia rigens occurs in sandy washes, gravelly canyon bottoms, rocky drainages, and moist, sandy slopes often along small streams associated with pinyon–juniper woodlands at 90–2,500 m. It ranges from California, Arizona, New Mexico, and Texas to northcentral Mexico in Aguascalientes, Baja California, Baja California Sur, Chihuahua, Durango, Jalisco, Michoacán, Puebla, Sonora, and Zacatecas.

260. Muhlenbergia rigida (Kunth) Kunth, Révis. Gramin. 1:63.

FIGURE 170A-G

Densely caespitose perennial. Culms 40–100 cm tall, stiffly erect, glabrous to scaberulous below the basal, terete nodes; usually 1 node per culm; internodes mostly glabrous. Sheaths 2-30 cm long, longer than the internodes, glabrous to scaberulous, rounded near base; ligules (1)3-12(15) mm long, often lacerate, firmer below, strongly decurrent; apex obtuse to acute; blades 12-35 cm long, 1-3 mm wide, flat or involute, not falcate, glabrous to scaberulous below and scaberulous to hirsutulous above. Panicles (4)10-35cm long, (2)3-5(15) cm wide, loosely contracted to open and lax, purplish; primary branches 0.4-10 cm long, sometimes capillary, ascending and spreading to 80° from the rachises; pedicels 1–10 mm long, mostly longer than the spikelets. Spikelets 3.5-5 mm long, purplish; glumes 1–1.7(2) mm long, about equal, 1-veined, unawned, apex obtuse to subacute, sometimes hirsutulous, rarely mucronate; lemmas 3.5-5 mm long, narrow lanceolate, scaberulous to scabrous, purple, awned, callus with hairs to 0.5 mm long, apex acuminate, the awn (5)10-22 mm long, flexuous; paleas 3.5-5 mm long, narrow lanceolate, purple, scaberulous, apex acuminate; anthers 1.7–2.3 mm long, purplish. Caryopsis 2–3.5 mm long, fusiform, brownish. 2n = 40, 44.

DISTRIBUTION AND HABITAT. *Muhlenbergia rigida* occurs on rocky slopes, ravines, and sandy, gravelly slopes derived from granitic and calcareous substrates associated with oak–pinyon–juniper woodlands at 1,200–2,500 m. It ranges from southeastern Arizona and southwestern New Mexico to southwestern Texas and throughout Mexico to South America in Andean Ecuador, Peru, Bolivia, and Argentina.

261. *Muhlenbergia robusta* (E. Fourn.) Hitchc., N. Amer. Fl. 17(6): 462. 1935.

Caespitose perennial. Culms 100–230(300) cm tall, erect, compressed-keeled near base, glabrous to sometimes pubescent

below the nodes; internodes glabrous. Sheaths 15-70 cm long, longer than the internodes, glabrous, becoming brownish below, sometimes shredded; sheath auricles present, (1)2-4(10) cm long, linear subulate to broadly triangular, longer above, straight or twisted, firm below; ligules 2–10(12) mm long, membranous, lacerate throughout; blades 40-100 cm long, 4-7 mm wide, folded sometimes involute toward tip, scaberulous above and below, the margins and keel saw-toothed. Panicles 30-80 cm long, (2)3-8 cm wide, narrow to loosely contracted, greenishgray to silvery gray or purplish; primary branches 1–15(17) cm long, naked on the lower ¼, ascending and closely appressed to spreading up to 40° from the rachises; pedicels 0.3–1.1 mm long, shorter than the spikelets, erect, scaberulous; central axis prominently ribbed, scabrous. Spikelets (1.8)2-3(3.2) mm long, erect, greenish-gray or purplish; glumes 1.8-3.2 mm long, usually longer than the floret, subequal, narrowly oblong to elliptic, veinless to indistinctly 1-veined, hyaline to greenish-gray, glabrous to scaberulous, apex acute to obtuse occasionally erose; lemmas 1.7–2.6 mm long, linear-oblong, unawned or rarely mucronate, greenish to yellowish-brown, glabrous or pubescent with scattered hairs on lower ½, the hairs up to 0.3 mm long, callus glabrous or with few hairs, apex acute, the mucro when present up to 1 mm long; paleas 1.7-2.6 mm long, glabrous to sparingly pilose between the veins on the lower ½, apex acute; anthers 1.1-2 mm long, purplish. Caryopsis 1.2-1.7 mm long, fusiform, brownish. 2n = 40.

DISTRIBUTION AND HABITAT. *Muhlenbergia robusta* occurs in mountainous areas from Sinaloa and Chihuahua south to Chiapas and Central America; found on rocky slopes, along barrancas (canyons), in pine and pine–oak forests, and in tropical deciduous forests at 850–3,000 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

262. Muhlenbergia schmitzii Hack., Ann. K. K. Naturhist. Hofmus. 17: 255. 1902.

FIGURE 163E-H

Caespitose annual; stout, appearing perennial. Culms 30–80 cm tall, scabrous below nodes, erect, little branched. Sheaths scabrous to apex, margins membranous, light brownish; ligules 2–3 mm long, membranous, apex obtuse to truncate, erose to deeply incised or toothed, margins entire; blades 5–20 cm long, 1.6–5 mm wide, flat, scabrous to glabrous. Panicles 12–36 cm long, 3.2–14 cm wide, spreading, elongated; branches 1.2–8 cm long, 1 occasionaly 2 per node, ascending or open; pedicels 1–1.5 mm long, strong, erect. Spikelets 2.5–3.4 mm long, wide, dorsally flattened, ascending, appressed along branches; glumes 1.3–2 mm long, subequal, scabrous, sometimes short-pubescent near apex and margins, 1-veined, awned, the awns 0.5–0.8 mm long; lower glumes ovate-lanceolate, acuminate; upper glumes oblong, abruptly acuminate, apex 2- to 3-lobed to tridentate; lemmas 2.5–3.2 mm long, oblong-ellipsoid, brown-yellowish with age,

veins prominent, sometimes dorsally flattened, silky-pubescent, appressed on midvein, hairs 0.3 mm long, apex entire to toothed, mucronate, the mucro $0.3{\text -}0.5 \text{ mm}$ long; paleas $2.6{\text -}3.4 \text{ mm}$ long, oblong-ellipsoid, a little longer than lemma, glabrous, apex bilobate, the lobes 0.3 mm long, acute; anthers $0.9{\text -}1.6 \text{ mm}$ long, purplish changing to brown-yellowish with age. Caryopsis $1{\text -}2 \text{ mm}$ long, oblong, compressed, straw-colored. n = 20.

DISTRIBUTION AND HABITAT. *Muhlenbergia schmitzii* occurs in humid areas in pine–oak forests at elevations of 1,500–2,460 m. It is endemic to Mexico and found in Chihuahua, Hidalgo, México, and Michoacán.

Muhlenbergia schmitzii is easily confused with M. flavida and M. strictior, and can be distinguished in having tall culms (30–80 cm tall), blades longer and wider (5–20 cm long and 1.6–5 mm wide), mucronate lemmas (mucro 0.3–0.5 mm long) rather than short-awned, and longer anthers (0.9–1.6 mm).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guadalupe y Calvo: Sierra Mohinora, about 3 mi S of La Rocha, 2250 m, Correll & Gentry 23228 (ENCB, US). Madera: Guayanopa Canyon, Sierra Madre, Sep 1903, 2000 m, M.E. Jones 7316 (US), isotype.

263. Muhlenbergia scoparia Vasey, Contr. U.S. Natl. Herb. 1(8): 283. 1893.

FIGURE 165A-E

Densely caespitose perennial. Culms 55-90 cm tall, glabrous to scaberulous, nodes and internodes glabrous. Sheaths basal, compressed-keeled, glabrous and scaberulous near the collar, undulate when mature, brown-reddish, fibrose; ligules 8–16 mm long, membranous, auricles absent; blades 25–50 cm long, 1-4.5 mm wide, flat or folded, toothed at the apex, scabrous. Panicles 20-30 long, 1.5-5 cm wide, somewhat open, the ascending to arching branches narrow, interrupted into groups along the rachis, light green to brown-reddish, rachis scabrous, with prominent ribs; primary branches 3.5-10 cm long, naked at base; secondary branches 1-5.5 cm long; pedicels of lateral spikelets 0.6-1.2 mm long, up to 3 mm long in terminal spikelets, scabrous. Spikelets 1.5-2.2 mm long; glumes shorter than the florets, subequal, mucronate, hyaline, veinless to 1-veined, glabrous to scaberulous apex acute; lower glumes 0.8-1 mm long; upper glume 1–1.5 mm long, the mucro to 1 mm long; lemmas 1.5-2 mm long, acuminate, awned, glabrous to scaberulous dorsally, the hairs 0.5-0.7 mm long, rigid, on proximal margins, the awn 8-15 mm long, emerging a little below of apex; paleas 1.5–2 mm long, glabrous; anthers 0.5–0.7 mm long.

DISTRIBUTION AND HABITAT. Muhlenbergia scoparia occurs in oak forests at elevations of 1,540–2,000 m. It is endemic to Mexico and is found in Chihuahua, Durango, Jalisco, Michoacán, Nayarit, Sinaloa, and Sonora.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Batopilas, 2000 m, C.G. Pringle 2350 (ENCB, MEXU); Batopilas, 2000 m, E. Palmer 766 (TAES); Potrero La

264. Muhlenbergia setifolia Vasey, Bot. Gaz. 7(8-9): 92. 1882.

Caespitose perennial. Culms 30-85 cm tall, erect, slender, slightly decumbent near base, hirsutulous below the terete nodes, 2-4 nodes per culm; internodes glabrous to hirsutulous. Sheaths 2-13 cm long, shorter than the internodes, glabrous to puberulent, basal sheaths rounded, margins whitish; ligules 4-7(10) mm long, membranous, firm below, decurrent, margins glabrous to puberulent and wider than ½ the adjacent blade width, apex acuminate, lacerate; blades 5-20(25) cm long, 1-2.5 mm wide, tightly involute to falcate, scaberulous below and scaberulous to hirsutulous above, the hairs less than 0.1 mm long. Panicles 8-20(25) cm long, (2)3-5 cm wide, loosely contracted, ovate; primary branches 0.5-7 cm long, capillary, ascending, appressed or spreading up to 70° from the rachises; pedicels 3–20 mm long, mostly longer than the spikelets, delicate, flexuous, glabrous and smooth. Spikelets 3.5-5.1 mm long; glumes 1.5-2.5 mm long, subequal, thin and hyaline, stramineous to reddish; lower glumes veinless, apex truncate or obtuse, often toothed or notched; upper glumes 1-veined or veinless, apex obtuse to acute often mucronate, the mucro less than 0.7 mm long; lemmas 3.5-5.1 mm long, narrow lanceolate, glabrous, smooth and shining, stramineous to reddish, awned, callus with hairs up to 0.6 mm long, apex acuminate, demarcation of lemma body and awn not evident, the awn 2–7(10) mm long, flexuous; paleas 3.5–5.1 mm long, as long as the lemma, narrow lanceolate, glabrous, apex acuminate; anthers 2-2.6 mm long, greenish. Caryopsis 2.4-3.2 mm long, fusiform, brownish. 2n = 40.

DISTRIBUTION AND HABITAT. Muhlenbergia setifolia grows on calcareous rocky slopes, on rock outcrops, and in desert grasslands associated with oak–pinyon–juniper woodlands at 1,000–2,250 m. It is found in western Texas, New Mexico, and northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua. Chihuahua: Sierra de la Campana, 10 km al W de la [hwy] Carr. Panamericana, 19 Sep 1973, pastizal [pasture-land], 1700 m, *J. 265. Muhlenbergia shepherdii (Vasey) Swallen, Contr. U.S. Natl. Herb. 29(4): 204. 1947. Sporobolus shepherdii Vasey,

Bull. Torrey Bot. Club 14: 8. 1887. *Blepharoneuron shepherdii* (Vasey) P. M. Peterson & Annable, Syst. Bot. 15(4): 519. 1990.

Caespitose annual. Culms 16-40 cm tall, scaberulous to strigoses below nodes, slender to quite thick, erect to geniculatespreading, with many branches near base; internodes 2.2-5 cm long. Sheaths 3.2-9 cm long, usually longer than internodes, glabrous, margins hyaline; ligules 1.4-2.8 mm long, membranous hyaline, apex irregularly toothed to lacerate, occasionally entire, truncate to obtuse, margins entire, decurrent; blades 4-8.5 cm long, 0.8-2 mm wide, flat to slightly involute, shortpubescent above and glabrous to scaberulous below. Panicles 8-18 cm long, 2.7-7 cm wide, open, branches 3-6 cm long, ascending to spreading 20°-70° from the culm axis, often capillary, 1 or 2 per node; pedicels 7–12 mm long, capillary, nodding and reflexed, minutely granular at the swollen apex. Spikelets 1.3-1.7(1.9) mm long; glumes subequal, green-grayish, glabrous, ovate to oblong, occasionally lanceolate, apex frequently acute; lower glumes 0.7-1.6 mm long; upper glumes 1-1.7 mm long; lemmas 1.3-1.7(1.9) mm long, green-grayish, lanceolate, appressed-pubescent to open, silky hairs on midvein and margins, these hairs often appearing as ridges on the surface of the lemma at 20× magnification, apex often obtuse; paleas 1.2-1.7 mm long, almost as long as lemma, villous between veins; anthers 0.8-1.4 mm long, brown. Caryopsis 1-1.7 mm long, dorsally compressed, flattened, yellow. n = 8.

DISTRIBUTION AND HABITAT. Muhlenbergia shepherdii occurs on wet seepage banks, washes, disturbed gravelly roadcuts, and slopes in pine–oak–madrone forests and pinyon–juniper woodlands with Arctostaphylos. It is endemic to Mexico and found in Chihuahua, Durango, Sonora, and Zacatecas at elevations of 1,900–2,900 m.

266. *Muhlenbergia sinuosa* Swallen, Contr. U.S. Natl. Herb. 29(4): 204. 1947.

FIGURE 177

Caespitose delicate annual. Culms 12–50 cm tall, erect, slender, very branched near base, sometimes geniculate-ascending, glabrous, scabrous below nodes. Sheaths glabrous or scabrous; ligule 1.5–3 mm long, hyaline, truncate to obtuse, toothed to lacerate; blades 2–8.5 cm long, 0.8–2 mm wide, flat to involute, short-pubescent to scabrous, midvein prominent. Panicle 10–26 cm long, 2.8–8 cm wide, branches 2.5–7 cm long, often capillary, 1 or 2 per node, ascending or something divergent, pedicels 4–7 mm long, slender, capillary, curved or reflexed. Spikelets 1.4–2 mm long, reflexed; glumes 0.7–1.2 mm long, equal, conspicuously pilose near apex and margins, hairs 0.3 mm long, 1-veined, apex acute to obtuse, awnless; lemma 1.4–2 mm long, oblong-elliptic, green, sometimes with purple spots, silky-pubescenct, short-appressed along midvein and margins, apex acute to obtuse, awnless; palea 1.3–1.8 mm long, oblong-elliptic,

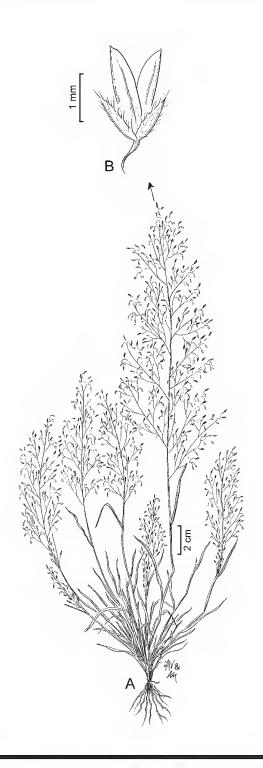

FIGURE 177. Muhlenbergia sinuosa. A. Habit. B. Spikelet. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

glabrous; anthers 0.6-1.2 mm long, olive-green. Caryopsis 0.8-1.2 mm long, fusiform, brown. n = 10, 12.

DISTRIBUTION AND HABITAT. *Muhlenbergia sinuosa* grows in pine forests at elevations of 1,650–2,300 m. It ranges from the United States to Mexico in Chihuahua and Sonora.

267. Muhlenbergia speciosa Vasey, Bull. Torrey Bot. Club 13(12): 231. 1886.

Densely caespitose perennial. Culms 1–1.5 m tall, strong, forming large mats, pilose below, hairs 1–1.5 mm long. Sheaths 35–60 cm long, compressed-keeled, pilose, auricles missing; ligules 0.5–1 mm long; blades 30–50 cm long, 2.5–4 mm wide, folded, pilose, pilose to somewhat glabrous. Panicles 40–60 long, 5–10 cm wide, straight or pendulous; branches 7–10(13) cm long, ascending or appressed, the upper divaricate, densely flowered, purplish to reddish; pedicels 0.5–2 mm long. Spikelets 1.2–2.2 mm long; glumes 1.4–2.3 mm long, longer than the lemma,

equal to subequal, apex obtuse, rarely awned, pilose, occasionally glabrous, hairs 0.5–0.7 mm long; lemma 1.2–2.2 mm long, pilose to sometimes glabrous, awned, the awn 8–12(17) mm long, flexuous, scabrous; paleas 1.2–2 mm long, pilose, obtuse; anthers 0.4–0.6 mm long, purplish.

DISTRIBUTION AND HABITAT. Muhlenbergia speciosa grows in oak and pine forests at elevations of 2,200–2,650 m. It occurs in Mexico in Chihuahua, Durango, Jalisco, Michoacán, Nayarit, and Sinaloa.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: 38.4 mi W of Guachochi on Mexico 127 towards Creel, 2440 m, *M.E. Siqueiros 1628* (MEXU). Moris: Southwestern Chihuahua, 1900 m, *E. Palmer 30* (MEXU, US) isotype.

268. Muhlenbergia strictior Scribn. ex Beal, Grass. N. Amer. 2: 263. 1896.

Caespitose annual; often decumbent. Culms 5-32 cm tall, strigulous below nodes, slender, branched. Sheaths with hyaline margins to green-yellowish, sparingly scabrous to apex; ligules 1.5-3.2 mm long, membranous, apex obtuse to truncate, erose or toothed, decurrent; blades 2-6.5 cm long, 1.2-2.5 mm wide, strigulose to minute-villous above, glabrous below. Panicles (3)5.2-11 cm long, 0.4-2(3.5) cm wide, contracted; branches 0.9-2.4 cm long, capillary, ascending, flowered to base, the florets overlapping, 1 or 2 per node. Spikelets 3-4.2 mm long, wide and dorsally flattened, straw color, short-pedicelled, appressed; glumes 1.2-2 mm long, subequal, glabrous to scaberulous near apex, 1-veined, narrow, acuminate, often mucronate, the mucros up 0.8 mm long; lower glumes ovate-lanceolate, apex acuminate; upper glumes oblong, apex abruptly acuminate, sometimes 2- to 3-lobed to 3-toothed; lemmas 3-4.2 mm long, oblong-ellipsoid, lanceolate, with prominent veins, yellowish when mature, with silky pubescence over the keels and margins, the hairs 0.3 mm long, apex entire or minute 2-toothed, the teeth 0.2 mm long, awned, the awns 1-3 mm long, delicate, straight; paleas 3-4.2 mm long, oblong-ellipsoid, glabrous, apex 2-toothed, the teeth 0.3 mm long; anthers 0.5–0.7 mm long, olive-green to light brown. Caryopsis 2-2.5 mm long, oblong, compressed, brown to yellowish. n = 10.

DISTRIBUTION AND HABITAT. Muhlenbergia striction grows in tropical and oak-pine forests at elevations of 1,500–2,650 m. It occurs in Mexico in Chihuahua, Distrito Federal, Durango, México, and Sonora.

269. *Muhlenbergia tarahumara* P. M. Peterson & Columbus, J. Bot. Res. Inst. Texas 3(2): 528–531, f. 1–2. 2009.

FIGURE 178

Caespitose perennial. Culms 18–35 cm tall, erect, terete near the base, glabrous below the nodes, usually 3 nodes per culm; internodes glabrous and shiny. Sheaths 0.8–8 cm long, shorter than the internodes above, pubescent or glabrous; ligules 1–1.8 mm long, membranous, abaxially pubescent or glabrous,

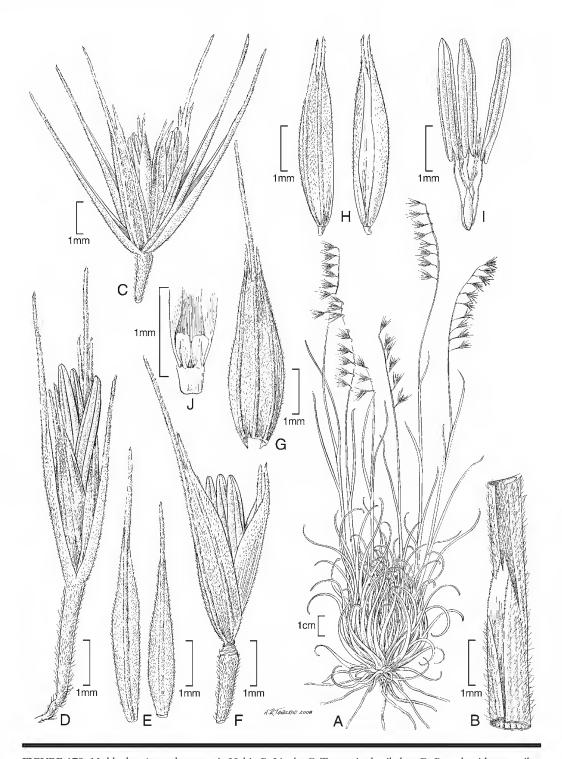

FIGURE 178. Muhlenbergia tarahumara. A. Habit. B. Ligule. C. Two paired spikelets. D. Branch with two spikelets (only one seen from this perspective). E. Glumes. F. Floret on branch axis (glumes, other spikelet removed). G. Lemma. H. Paleas. I. Stamens and pistil. J. Lodicules. Drawn by Alice R. Tangerini for Smithsonian Institution, Department of Botany.

apex acute, often erose, minutely ciliolate; blades (2)3.5-13 cm long, 0.2-1.3 mm wide, flat to tightly involute, apically acuminate, somewhat sinuous, antrosely hirsute on both surfaces, the hairs 0.1-0.4 mm long. Panicles 3-6 cm long, 0.7-1.6 cm wide, narrow, with 5-13 racemosely arranged primary branches, 1 branch per node; branches 0.5-1.4 cm long, with 2 terminal spikelets, deciduous, disarticulation near the base, branches first ascending then spreading (bending sharply or curling near the base) from the culm axis, antrorsely hirsute, the hairs 0.2-0.4 mm long; inflorescence axis flattened, ending in terminal branch, margins hirsute; pedicels fused or 0.2-0.6 mm long, 1 slightly longer than the other, tightly appressed. Spikelets 4.5-7.8 mm long, appressed to one another, 1-flowered; glumes 3-5.8 mm long, narrowly lanceolate, usually equal in length, shorter than the lemma, membranous to chartaceous, 1-veined, pubescent, apex acuminate, awned, the awns 1.4-3.2 mm long; lemmas 3.6-7.3 mm long, lanceolate, awned, distinctly 3-veined, membranous to chartaceous, appressed-pubescent, apex acute to acuminate, bifid, the central awn 2-3.7 mm long, straight or slightly recurved, the lateral veins excurrent into awns 0.6-1.3 mm long; paleas 3-4.6 mm long, shorter than the lemma, membranous, glabrous below and appressed-pubescent near apex, 2-veined, apex acuminate, each vein excurrent as a mucro, the mucro 0.2-0.9 mm long; anthers 2.2-2.8 mm long, yellowish-orange.

DISTRIBUTION AND HABITAT. Muhlenbergia tarahumara is known only from three locations in the Sierra Madre Occidental in Chihuahua, and a single location in Durango (Peterson & Herrera Arrieta 25508 [CIIDIR, US], Mpio. Santiago Papasquiaro near jtn of hwy 36 and turnoff to San Diego trout farm), and it occurs on rocky slopes, ridgetops, and white-tuff rock outcrops with Pinus spp., Pinus lumholtzii B. L. Rob. & Fernald, Arctostaphylos pungens Kunth, Quercus, Cupressus, Ceanothus, Muhlenbergia lucida, M. montana, and M. rigida at 1,880–2,407 m (Peterson and Columbus, 2009).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: 2 km W of Rio Coraréachi and E of Osichi, 1960–2040 m, 30 Aug 2003, P.M. Peterson & P. Catalán 17621 (CIIDIR, RSA, US); 41.3 km S of Creel on road to Batopilas, 2075 m, 10 Sep 1989, P.M. Peterson, Annable & Y. Herrera 8032 (ENCB, RSA, US); Yamuco, 1 mi E of hwy N of Rio Urique crossing towards Basihuare and Creel, 1880–1900 m; 26 Aug 2003, P.M. Peterson & P. Catalán 17542 (CIIDIR, RSA, US); P.M. Peterson & J.M. Saarela 22053, 22079 (US).

270. *Muhlenbergia tenuifolia* (Kunth) Kunth, Révis.Gramin. 1(4): 63. 1829.

FIGURE 179

Loosely caespitose to densely tufted, annual to short-lived perennial with delicate base, flowering the first year. Culms 20–70 cm tall, erect or decumbent at the base, branching at the lower and middle nodes, wiry, scaberulous below the terete nodes; internodes generally 2.0–9.5 cm long. Sheaths 4.0–7.5 cm long, commonly shorter than the internodes, glabrous or scaberulous;

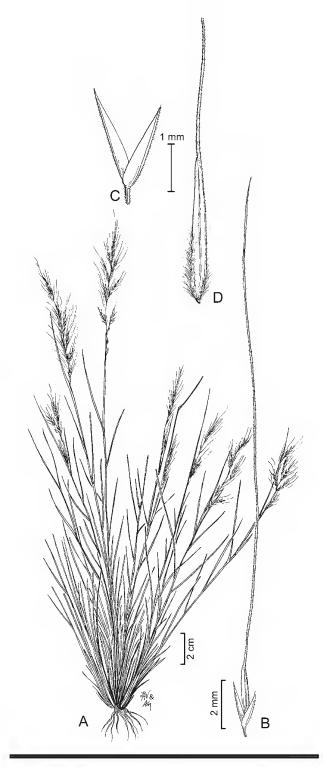

FIGURE 179. *Muhlenbergia tenuifolia.* A. Habit. B. Spikelet. C. Glumes. D. Floret. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

ligules 1.2-3.0(5.0) mm long, membranous, apex acute, often lacerate with age; blades 2-13 cm long, 1.2-2.5 mm wide, flat or loosely involute, scaberulous to glabrous below and scabrous above. Panicles 7-20 cm long, 1.0-6.5 cm wide, narrow and contracted to loosely spreading, interrupted below, terminal and axillary, 15-23 nodes per panicle; primary branches 3.5-7.5 cm long, usually 1 per node, when immature the branches mostly appressed and ascending, when mature the branches sometimes widely spreading to 70° from the rachises; pedicels 1–3 mm long, usually shorter than the spikelets, antrorsely scabrous, stout, appressed or spreading. Spikelets 2-4 mm long, erect, often purplish; glumes 1.2-2.8 mm long, unequal, 1-veined, scabrous along the veins, apex acute to acuminate, often mucronate or erose, the mucro to 0.5 mm long; lower glumes 1.2-2.0 mm long; upper glumes 1.5–2.8 mm long, more than ½ as long as the lemma; lemmas 2.0-3.5(4.0) mm long, lanceolate, widest near the base, awned, scaberulous above and villous on proximal ½ along the margins and the midvein, the hairs 0.5-1.5 mm long, callus short-pubescent, the awn 10-30(40) mm long, scabrous, flexuous; paleas 1.8-3.4(3.8) mm long, lanceolate, sparsely appressed-pubescent between the veins on the proximal ½; anthers 0.9-1.5 mm long, yellowish. Caryopsis 1.0-2.2 mm long, narrowly fusiform, terete, brownish. 2n = 20, 40.

DISTRIBUTION AND HABITAT. Muhlenbergia tenui-folia grows on rocky slopes, limestone rock outcrops, gravelly roadsides, and sandy drainages in grama grasslands and oak-pinyon-juniper woodlands at 1,200–2,500 m. It ranges from southern Arizona, New Mexico, and Texas south throughout Mexico in the mountains to Venezuela, Bolivia, Peru, and Argentina.

271. *Muhlenbergia texana* Buckley, Proc. Acad. Nat. Sci. Philadelphia 14: 91. 1862.

FIGURE 180

Caespitose, delicate annual. Culms 10–40 cm tall, erect, strigulose below the nodes; internodes 9–35 mm long. Sheaths 2.5–4 cm long, shorter or longer than internodes, strigulose; ligules 1–2.5 mm long, hyaline, apex lacerate, acute to obtuse;

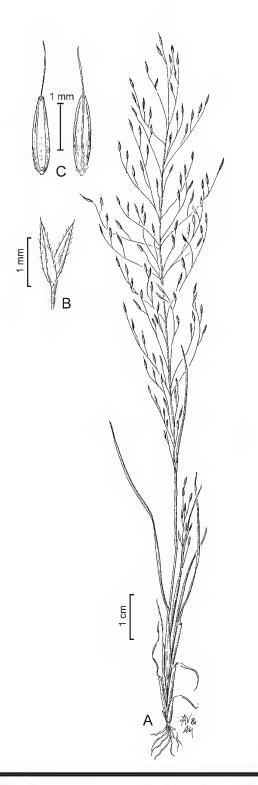

FIGURE 180. Muhlenbergia texana. A. Habit. B. Glumes. C. Two florets. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

blades 2–8 cm long, 0.8–2 mm wide, flat or involute, scabrous to sparsely strigulose. Panicles 9–20 cm long, 2–6 cm wide; branches 1–6 cm long, ascending or open, occasionally capillary, spreading up to 70° from the culm axis; pedicels 2–7 mm long, longer than florets, usually spreading. Spikelets 1.4–2.2 mm long, ascending, straight; glumes 0.8–1.5 mm long, subequal, sparsely hirsute to pilose near apex and along margins, 1-veined, apex acute or acuminate; lower glumes 0.8–1.2 mm long; upper glumes 0.9–1.5 mm long, slightly wider near base than lower glume; lemmas 1.4–2.2 mm long, lanceolate, awned, short-pubescent along the raised midvein and margins on proximal ½, apex acute or acuminate, mucronate or with awn up to 2 mm long; paleas 1.4–2.2 mm long, oblong-elliptic, minutely appressed-pubescent at the base, apex acute; anthers 0.4–0.5 mm long, purplish. Caryopsis 0.8–1 mm long, fusiform, brown. n=20.

DISTRIBUTION AND HABITAT. *Muhlenbergia texana* grows in oak–pine–cedar forests at elevations of 1,420–2,650 m. It ranges from United States to Mexico in Baja California, Baja California Sur, Chihuahua, Durango, Nayarit, Sinaloa, and Sonora.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 64.5 km W of Balleza and 30.6 km E of Guachochi, 2650 m, P.M. 272. Muhlenbergia torreyi (Kunth) Hitchc. ex Bush, Amer. Midl. Naturalist 6: 84. 1919.

FIGURE 181

Caespitose perennial. Culms 10-40(50) cm tall, decumbent at base, hirsute below the nodes, usually no culm nodes exposed above the tightly clustered leafy base, the leafy portion not reaching more than 1/5 the plant height; internodes mostly scabrous to glabrous. Sheaths 0.1-2.5(3.2) cm long, shorter than the internodes, scaberulous to glabrous, margins hyaline; ligules 2-5(7) mm long, hyaline, often splitting down the middle and appearing as auricles, apex acuminate, lacerate, margins entire; blades 1-3(5) cm long, 0.3-0.9 mm wide, tightly involute or folded, arcuate, somewhat sharp pointed, scaberulous. Panicles 7-21 cm long, 3-15 cm wide, open, diffuse; primary branches 1-8 cm long, ascending to stiffly spreading at maturity 30°-90° from the rachises; pedicels 1-8 mm long, erect, sometimes appressed to the branches. Spikelets 2-3.5 mm long, erect; glumes 1.3-2.5 mm long, about equal in length, 1-veined, awnless, mucronate or awned, scaberulous toward apex, apex acute to acuminate, minutely erose, the mucro or awn to 1.1 mm long; lemmas 2-3.2(3.5) mm long, narrow elliptic to lanceolate, mucronate or awned, appressed-pubescent on the margins and midvein on the proximal ½ to ¾, scabrous above, apex acuminate, the mucro or awn 0.5–4 mm long; paleas 2–3.2(3.5) mm long, narrow elliptic, sparsely pubescent between the veins, apex acuminate, sometimes with 2 mucros, the mucros 0.2 mm long; anthers 1.2–2.1 mm long, greenish. Caryopsis 1.7–2.0 mm long, fusiform, brownish. 2n = 20, 21.

DISTRIBUTION AND HABITAT. Muhlenbergia torreyi grows in desert grasslands, sandy mesas, calcareous rock outcrops, rocky slopes, and open woodlands at 1,000–2,450 m; it ranges from the south central United States to northern Mexico in Chihuahua and Sonora and is disjunct in northwestern Argentina and Bolivia.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Janos: Chihuahua–Sonora border, Rancho Carretas, 1780 m, A.A. Beetle M-7975 (MEXU).

273. Muhlenbergia tricholepis (Torr.) Columbus, Aliso 28: 66.
2010. Blepharoneuron tricholepis (Torr.) Nash, Bull. Torrey
Bot. Club 25(2): 88. 1898. Muhlenbergia tricholepis (Torr.)
P. M. Peterson, Amer. J. Bot. 97(9): 1546. 2010.

Densely tufted, caespitose perennial. Culms 10-70 cm tall, 0.3-0.7 mm diameter just below the inflorescence, glabrous to scabrous just above and below nodes, slender, erect; internodes 1.2–10 cm long. Sheaths 1.8–9.5 cm long, shorter or longer than internodes, usually glabrous, crowded near the base, the margins glabrous, occasionally scabrous, whitish; ligules (0.3)0.7–2(2.7) mm long, hyaline to opaque, truncate to obtuse, margins entire, decurrent, apex erose-toothed to finely ciliate and irregularly toothed; blades 1-15 cm long, 0.6-2.5 mm wide, filiform, involute, arcuate, scabrous in both surfaces, the midvein evident, raised abaxially. Panicles 3-25 cm long, 1-10 cm wide, narrow or open; primary branches 1–6 cm long, ascending, spreading up to 50° from the rachises, 1-3 per node; pedicels 2-9 mm long, slender, capillary, minutely granular just below the spikelet, flexuous nodding to reflexed; 5-25 nodes per panicle. Spikelets 2.3-3.4(3.8) mm long, grayish-green; glumes (1.5)1.8-3.2(3.7) mm long, nearly equal to subequal in length, grayish-green (olivaceous) and occasionally purplish tinged, glabrous, ovate to oblong-elliptical, the apex obtuse to acute often irregularly toothed; lower glumes (1.5)1.8-2.6(3) mm long; upper glumes (1.7)2-3.2(3.7) mm long, broader and often appearing 3-veined by its characteristic folding, however, only the midvein contains a vascular trace; lemmas (2)2.3-3.4(3.8) mm long, lanceolate, grayish-green (olivaceous), often purplish tinged, apex acute to obtuse with a thick covering of appressed to spreading tawny to shining silky hairs on the midvein and margins, the hairs to 1.2 mm long; paleas (2)2.2-3.5(3.9) mm long, densely villous between the veins; anthers 1.2–2.1 mm long, brownish. Caryopsis 1.2-1.4 mm long, fusiform to elliptic, the embryo with a dorsal ridge extending $\frac{2}{3}$ of the grain, light brownish. 2n = 16.

DISTRIBUTION AND HABITAT. *Muhlenbergia tricholepis* occurs in dry rocky to sandy slopes, canyon walls, rock outcrops, dry meadows, and open woods in pine–oak–madrone forests with *Arctostaphylos* spp., pinyon–juniper woodlands, spruce–fir forests, and pine woodlands at 700–3,660 m. It occurs

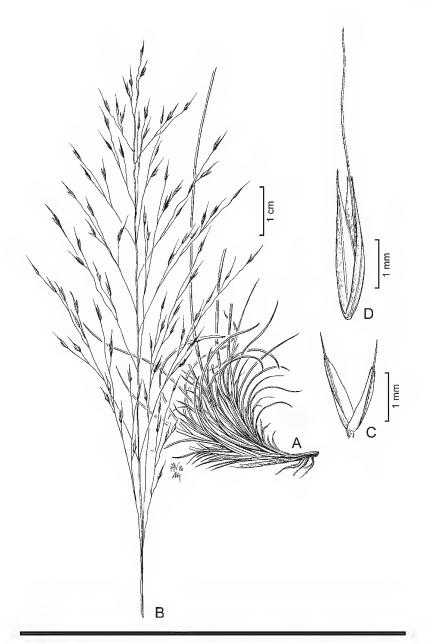

FIGURE 181. Muhlenbergia torreyi. A. Habit. B. Inflorescence. C. Glumes. D. Floret. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

in central Mexico north throughout the Sierra Madre Occidental and Sierra Madre Oriental.

274. Muhlenbergia uniseta (Lag.) Columbus, Aliso 28: 66. 2010. Hymenothecium unisetum Lag., Gen. Sp. Pl. 4. 1816. Aegopogon tenellus (DC.) Trin.

FIGURE 149A,B

Slender often sprawling, caespitose annual. Culms (2) 6–30 cm tall, glabrous below the nodes; internodes 0.6–6 cm long, glabrous to pilose. Sheaths mostly 0.5–4.8 cm long, shorter than the internodes, glabrous to sparsely pilose; ligules 0.6–1.5 mm long, apex mostly truncate, lacerate; blades 1.5–6 cm long,

0.5-1.5(1.7) mm wide, flat, scaberulent and pubescent above, smooth beneath. Panicles 2–6 cm long, 0.5-1.2 cm wide, open, loosely flowered; racemose primary branches 3–5 mm long, excluding the awns, 1 per node. Spikelets 1.5-3.2 mm long, often greenish or purplish, the clusters with 1 short-pedicelled spikelet (perfect), the pedicels 0.2-0.6 mm long, and the other 2 spikelets (staminate or sterile) short-pedicelled, the pedicels about 0.7-1.5 mm long; glumes (1)1.3–2 mm long, oblong and wider distally, apex deeply notched, entire or mucronate, the mucro 0.2-1 mm long, lobes obtuse or rounded; lemmas 2.5-3.2 mm long, 3-awned, the central awns 3-8(11) mm long, lateral awns usually mucronate or awned up to 2 mm long or missing; paleas 2.2-3 mm long, puberulent, apex 2-mucronate, the mucros less than 0.8 mm long; anthers 0.5-0.8 mm long, yellowish. Caryopsis 1.1-1.3 mm long, obovoid, light brownish. 2n = 20, 60.

DISTRIBUTION AND HABITAT. *Muhlenbergia uniseta* grows on moist slopes, cliffs, canyons, roadsides and along or near springs, usually in shaded areas associated with *Pinus* and *Quercus*, at 1,300–2,860 m. It ranges from southern Arizona to most of Mexico and Central America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 56.4 km W of Parral on road to Balleza and 35.5 km S of Balleza, 18 Sep 1991, pine forest-encino [oak], 2210 m, P.M. 275. Muhlenbergia utilis (Torr.) Hitchc., J. Wash. Acad. Sci. 23(10): 453. 1933.

FIGURE 175E-I

Perennial; with slender, scaly rhizomes. Culms 7-30 cm tall, erect to decumbent, older plants trailing, up to 1 m long, minutely pubescent to glabrous below the nodes; internodes mostly smooth to lightly nodulose roughened. Sheaths 0.3–2.4 cm long, shorter or longer than the internodes, glabrous, margins hyaline; ligules 0.2-0.8 mm long, membranous, decurrent, apex truncate; blades 0.5-4.7 cm long, 0.2-1.8 mm wide, involute, sometimes flat, straight or arcuate-spreading, blades often at right angles to culms, mostly glabrous abaxially and hirsutulous adaxially. Panicles 1-5 cm long, 0.1-0.4 cm wide, narrow, contracted, interrupted between each branch, partially included in the upper sheaths; primary branches 0.2-1.2 cm long, appressed, rarely ascending to 30° from the rachises; rachises usually visible between the branches; pedicels 0.1-1.1 mm long, glabrous. Spikelets 1.4-2.4 mm long, erect; glumes 0.5-1.4 mm long, ½ to ½ as long as the lemma, subequal, unawned, glabrous, usually 1-veined, occasionally 2- to 3-veined, yellowish to light green, apex acute; lemmas 1.3-2.4 mm long, lanceolate, unawned, glabrous or with minute appressed pubescence along the margins and the base, the hairs about 0.1 mm long, green or purplish, apex acute; paleas 1-2 mm long, lanceolate, glabrous, apex acute; anthers 0.7-1.4 mm long, yellow to purplish. Caryopsis 0.7-1.2 mm long, ellipsoid to ovoid, brown. 2n = 20.

DISTRIBUTION AND HABITAT. *Muhlenbergia utilis* occurs in wet soils along streams, ponds, depressions in grasslands, and alkaline or gypsiferous plains associated with *Quercus* spp. at 200–2,500 m. It ranges from the southern United States to Mexico in Chiapas, Chihuahua, Durango, Guanajuato, Hidalgo, Jalisco, México, Distrito Federal, Michoacán, Puebla, Querétaro, Sonora, Veracruz, and Zacatecas, and to Costa Rica.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Casas Grandes: 5 km al NE de Cuesta Blanca, 1980 m, M.A. Martínez s.n. (ENCB). Cuauhtémoc: 12 mi W of Cuauhtemoc, 2128 m, Reeder & C. Reeder 2622 (ENCB, US). Chihuahua: Hills near Chihuahua, 1800 m, C.G. Pringle 418 (US); La Campana, 10 km W carr. [hwy] Panamericana, 1700 m, F.W. Gould 8911 (TAES). Madera: Mesa de El Poleo, ejido El Long, 2400 m, Blanco 08/77 (IBUG).

276. Muhlenbergia vaginata Swallen, Contr. U.S. Natl. Herb. 29(9): 406. 1950.

Annual or short-lived perennial. Culms 16–40 cm tall, lax, slender, glabrous, decumbent, rooting at the lower nodes. Sheaths 0.7–1.6 cm long, shorter than the internodes, glabrous; ligules 1.3–3 mm long, hyaline, apex acute to obtuse, decurrent; blades 0.5–3.5(4) cm long, 0.6–1.8(2) mm wide, mostly cauline, flat or folded, with navicular apex, glabrous to scabrous. Panicles

0.5-3 cm long, 3-7 mm wide, frequently partially included in the upper sheath; branches 3-10 mm long, ascending or appressed; pedicels 0.5-3 mm long, appressed, scabrous. Spikelets 1.6-2.5 mm long; glumes 0.6-1 mm long, subequal, glabrous, 1-veined, oblong to ovate, light green to green-grayish, apex obtuse, rounded to subacute, occasionally erose; lower glumes 0.6-0.8 mm long; upper glumes 0.6-1 mm long; lemmas 1.6-2.5 mm long, lanceolate, sparsely pubescent below and along the midvein and margins, mottled with olive-green spots, often purplish, apex scabrous, acuminate, sometimes mucronate, the mucro 0.2 mm long; palea 1.5-2.5 mm long, lanceolate, glabrous or with a few hairs between the veins; anthers 0.5-0.8 mm long, purplish. Caryopsis 1-1.2 mm long, ellipsoid to fusiform, brown. n=9.

DISTRIBUTION AND HABITAT. Muhlenbergia vaginata occurs in pine—oak forests at elevations of 1,880–2,400 m and ranges from Mexico to Central America. In Mexico it is found in Chiapas, Chihuahua, Distrito Federal, Durango, Hidalgo, Jalisco, México, Michoacán, Morelos, Puebla, Querétaro, Sinaloa, Tlaxcala, and Veracruz.

Ocampo: Along trail just above Cascada Basaseachic, 1880 m, P.M. Peterson & Annable 12523 (US); Approx. 10 mi E of Basaseachic on Hwy towards La Junta, 2110 m, P.M. Peterson & Annable 12541 (US). Riva Palacio: Cumbres de Majalca, 21.5 mi W of Hwy 45, 2200 m, P.M. Peterson & Annable 4575 (ENCB, US).

277. Muhlenbergia villiflora Hitchc., N. Amer. Fl. 17(6): 470. 1935.

Perennial; with scaly rhizomes. Culms 4–20(27) cm tall, to 2 mm thick, erect, wiry, smooth to nodulose roughened below the nodes; internodes smooth or nodulose. Sheaths 5–15 cm long, shorter than the internodes, about ½ the length of the internodes, glabrous to nodulose roughened, margins hyaline;

ligules 0.4-1.5 mm long, membranous, decurrent, apex acute, erose and toothed; blades 0.7-2 cm long, 0.2-1.2 mm wide, involute, arcuate-spreading, glabrous below and hirsutulous above. Panicles 1-5 cm long, 0.1-0.5 cm wide, narrow, contracted, loosely flowered, usually on an exserted peduncle; primary branches 0.2-1.1 cm long, appressed, ascending; pedicels 0.1-0.8(1.2) mm long, shorter than the spikelets, minutely setose. Spikelets 1.4-2.4 mm long; glumes 0.6-1.8 mm long, equal, unawned, glabrous, usually 1-veined, occasionally 2- to 3-veined, ½ to ¾ the length of the floret, green or purple, apex acute; lemmas 1.4-2.4 mm long, lanceolate, indistinctly 3-veined, mucronate or not, green or purplish, densely villous along the midvein and margins on the proximal 45, the hairs 0.4-1 mm long, apex acute, the mucro 0.1-0.6 mm long; paleas 1.2-2.1 mm long, lanceolate, densely villous between the veins on the proximal \(^2\)3, apex acute; anthers 0.8-1.5 mm long, yellow, dark green, or purple. Caryopsis 1-1.4 mm long, ellipsoid to fusiform, dark brown. 2n = 20, 22.

DISTRIBUTION AND HABITAT. Muhlenbergia villiflora occurs in openings primarily on alkaline soils derived from gypsum, rocky flats, and desert grasslands, usually in small, isolated populations at 1,500–2,100 m. In Mexico, Muhlenbergia villiflora var. villiflora also occurs in Durango, San Luis Potosí, and Zacatecas.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

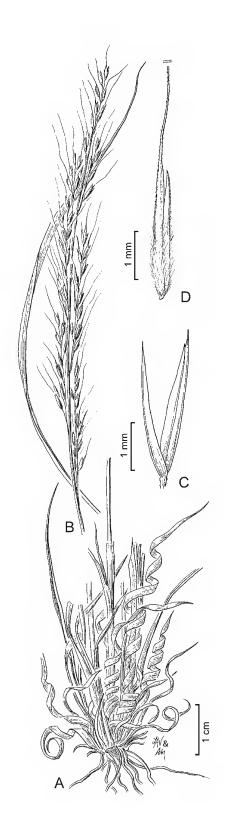

278. Muhlenbergia virescens (Kunth) Trin., Gram. Unifl. Sesquifl. 193, t. 5a, f. 7. 1824.

Muhlenbergia straminea Hitchc., Muhlenbergia curvula Swallen.

FIGURE 182

Plants perennial; caespitose. Culms 25–70(100) cm tall, erect, rounded near the base; internodes glabrous. Sheaths 10–30 cm long, glabrous, stiff, becoming flat, ribbonlike or papery, and conspicuously spirally coiled when old; ligules (6)10–20 mm long, hyaline, acuminate, lacerate; blades 10–30 cm long, (0.5)1–4 mm wide, flat to involute, scabrous abaxially, spiculate adaxially. Panicles 10–25 cm long, 1–8 cm wide, loosely flowered, stramineous; primary branches 0.6–8 cm long, appressed or diverging up to 30° from the rachises; pedicels 0.2–5 mm long, scabrous. Spikelets 4–7 mm long, light grayish-green to white; glumes 3.5–6(7) mm long, scaberulous, unawned, rarely mucronate; lower glumes shorter than the upper glumes, 1-veined; upper glumes equaling or exceeding the florets, 3-veined, apex

FIGURE 182. *Muhlenbergia virescens*. A. Habit. B. Inflorescence. C. Glumes. D. Floret. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

acuminate to acute; lemmas 3.5–5.5(6) mm long, lanceolate, pubescent on the lower ½ along the midveins and margins, hairs to 1 mm long, apex scabrous, acuminate, awned, the awns 12–27 mm long, flexuous; paleas 3.5–5.5 mm long, lanceolate, pilose between the veins, apex scaberulous, acuminate; anthers 2–3.5 mm long, purple. Caryopses 1.9–2 mm long, fusiform, light brown.

DISTRIBUTION AND HABITAT. Muhlenbergia virescens grows on rocky slopes, volcanic tuffs, canyon bottoms, and ridges, usually in open pine forests, at elevations of 1,800–2,600 m. It is known from the southwestern United States and north central Mexico.

FIGURE 183

Caespitose perennial. Culms 15-60 cm tall, erect with knotty, thickened bases, flattened, strigose to hirsute below the nodes; internodes hirsute to almost glabrous. Sheaths 1.2-7.5 cm long, mostly shorter than the internodes, glabrous to scaberulous, compressed-keeled near the base; ligules 1-3(5) mm long, membranous, apex truncate; blades 1.4-12 cm long, 1-3 mm wide, flat to folded, slightly keeled, strigose adaxially glabrous to scaberulous abaxially. Panicles 5-16 cm long, 0.2-1.2 cm wide, narrow, densely flowered, contracted and spikelike; branches 0.3-2 cm long, ascending and tightly appressed; pedicels 0.1-1.4 mm long, shorter than the spikelets. Spikelets 2–3 mm long, dark green or plumbeous; glumes 0.5–1.6 mm long, about equal, 1-veined, mucronate, scaberulous along midvein, apex abruptly narrowed, acute or obtuse, the mucros 0.5-1 mm long; lemmas 2-3 mm long, lanceolate, mucronate, plumbeous, sometimes mottled with greenish-black areas and lighter areas, with short appressed pubescence along the margins and midvein on the proximal ½ to ¾, the hairs about 0.5 mm long, apex acute to acuminate, scaberulous, the mucro 0.3-1 mm long; paleas 1.9-3 mm long, lanceolate, short appressed pubescence between the veins on the proximal 34, apex acute to acuminate, the veins sometimes mucronate, the mucros to 0.3 mm long; anthers 1.3–1.8 mm long, greenish. Caryopsis 1.2–2 mm long, fusiform, brownish.

DISTRIBUTION AND HABITAT. Muhlenbergia wrightii is found growing in gravelly prairies, grassy flats, rocky slopes, and open wet and dry meadows on granitic, sandstone, or limestone derived soils and is associated with *Pinus* spp., *Juniperus* spp., and *Quercus* spp. at 1,100–3,000 m. This species occurs in southwestern Utah, eastern Arizona, New Mexico, and western Colorado to northern Mexico in Baja California, Chihuahua, Durango, and Sonora.

Munroa Torr.

Annual; stoloniferous, mat-forming; stolons 2-8 cm long, terminating in involucres of leaves from which new culms arise. Culms 3-15(30) cm. Leaves mostly basal, sometimes with a purple tint; sheaths with a tuft of hairs at the throat; auricles absent; ligules of hairs; blades linear, usually involute, sometimes flat or folded, with white, thickened margins, apex sharply pointed. Inflorescences terminal, capitate panicles of spikelike branches; branches almost completely hidden in a subtending leafy bract, with 2-4 subsessile or pedicellate spikelets. Spikelets laterally compressed, with 2-10 florets; lower florets bisexual or pistillate; terminal florets sterile; disarticulation above the glumes or beneath the leaves subtending the branches. Glumes shorter than the spikelets, keeled, 1-veined, unawned; lower glumes usually present on all spikelets (absent from all spikelets in M. mendocina); upper glumes absent or reduced on the terminal spikelet; lemmas with a pilose tuft of hairs along the margins at midlength, membranous or coriaceous, 3-veined, lateral veins occasionally shortly excurrent, apex emarginate or 2-lobed; paleas glabrous, smooth; lodicules present or absent, truncate; anthers 2 or 3, yellow; style branches elongate, 2(3), barbellate. Caryopsis dorsally compressed. x = 7 or 8.

Munroa, a genus of five species, is endemic to the Western Hemisphere. One species occurs in Chihuahua.

280. *Munroa squarrosa* (Nutt.) Torr., Pacif. Railr. Rep. 4(5): 158. 1857.

FIGURE 184

Stolons slender. Culms 3-15(30) cm long, highly branched, scabrous, often minutely puberulent. Sheaths shorter than the internodes, membranous; ligules 0.5-1 mm long; blades 1-5 cm long, 1-2.5 mm wide. Spikelets 6-8(10) mm long, with 3-5 florets; glumes 2.5-4.2 mm long, first 1-2 spikelets subequal, narrow, 1-veined, acute; glumes of upper spikelets unequal; lower glumes reduced or even absent in the terminal spikelets; lemmas in lower spikelets scaberulous, lanceolate, midvein excurrent, forming a stout, scabrous awn, the awn 0.5-2 mm long, lateral veins with a tuft of hairs on the margins near midlength, excurrent; anthers 1-1.5 mm long. 2n = 16.

DISTRIBUTION AND HABITAT. Munroa squarrosa grows in dry, open areas, usually in sandy soil or disturbed sites, from Saskatchewan and Alberta south to Chihuahua, Mexico.

Nassella Desv.

Plants usually perennial, rarely annual; caespitose, occasionally rhizomatous. Culms branched at the upper nodes, branches flexible; prophylls not evident, shorter than the sheaths. Leaves mostly basal, not overwintering; sheaths open; cleistogenes sometimes present; auricles absent; ligules membranous, sometimes pubescent or ciliate; blades basal, apex narrowly acute to acute, not

sharp, flag leaf blades present, bases about as wide as the top of the sheaths. Inflorescences terminal panicles, sometimes partially included at maturity. Spikelets with 1 floret; rachillas not prolonged beyond the base of the floret; disarticulation above the glumes, beneath the floret. Glumes longer than the floret, narrowly lanceolate or ovate, basal portion usually purplish at anthesis, color fading with age, (1)3- to 5-veined, sometimes awned; florets usually terete, sometimes slightly laterally compressed; calluses blunt or sharp, glabrous or antrorsely strigose; lemmas usually papillose or tuberculate, at least distally, sometimes smooth throughout, glabrous or variously hairy, strongly convolute, wrapping 1.2-1.5 times around the caryopsis, apex not lobed, fused distally into crowns, these often evident by their pale color and constricted bases; crowns mostly glabrous, rims often bearing hairs with bulbous bases; awns terminal, centric or eccentric, deciduous or persistent, usually twice-geniculate, second geniculation often obscure; paleas up to ½ as long as the lemmas, glabrous, without veins, flat; lodicules 2 or 3, if 3, the third somewhat shorter than the other 2; anthers 1 or 3, if 3, often of 2 lengths, penicillate; ovaries glabrous; styles 2, bases free. Caryopsis glabrous, not ribbed. x = 7, 8.

Nassella used to be interpreted as a genus of approximately 14 species but now has about 125 species primarily in South America.

281. *Nassella mucronata* (Kunth) R. W. Pohl, Taxon 39(4): 611. 1990.

Perennial. Culms 60-100 cm tall, erect or geniculate, ascending, nodes pubescent. Sheaths glabrous, margins hairy; ligules 0.5-1 mm long, membranous; blades 10-20 cm long, 1-3 mm wide, flat or involute, pubescent, sparsely hairy on both sides. Panicles 10-30 cm long, open, linear, dense, nodding, branches appressed or ascending. Spikelets 8–10 mm long, solitary, pedicelled, lanceolate, subterete, disarticulating below each fertile floret, callus about 2 mm long, elongated, pubescent (tawny), acute; glumes 25-40 mm long, persistent, equal, exceeding apex of florets, thinner than fertile lemma, oblong, membranous, purple; lower glumes 3-veined, primary vein scabrous, apex acuminate; upper glumes 5-veined, apex acuminate; lemmas 5-6 mm long, 1 mm wide, 5-veined, oblong, subterete, coriaceous, dark brown, papillose, rough above, pubescent, hairy below, margins convolute and covering most of palea, apex with a short cylindrical neck, surmounted by a ring of hairs, the hairs 0.5 mm long, awned, the awn 35-50 mm long, 2-geniculate, with a twisted column, the column 9–10 mm long, middle segment of awn 8-9 mm long; paleas 2-veined; anthers 3, 4-4.5 mm long.

DISTRIBUTION AND HABITAT. Nassella mucronata is known from Mexico and South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Reported in Espejo Serna et al. (2000).

Oplismenus P. Beauv.

Annual or perennial. Culms weak, trailing on the ground, branching. Leaves cauline; ligules membranous and ciliate, or of hairs; blades lanceolate. Inflorescences terminal, panicles of unilateral branches, spikelets paired (but the first spikelet sometimes reduced), rachises and branches terminating in a spikelet; branches persistent; disarticulation below the glumes. Spikelets dorsally compressed, not sunken into the rachis, lacking subtending bristles, with 2 florets. Lower glumes awned; upper glumes not ciliate on the margins, unawned or with awns shorter than those of the lower glumes, awns of both glumes often becoming

viscid; lower florets sterile or staminate, lower lemmas acute to short-awned, lower paleas present or absent; upper florets bisexual; upper lemmas papery to leathery, glabrous, smooth, unawned, white or yellow at maturity; upper paleas similar to the upper lemmas. x = 9.

Oplismenus is a genus of 11 closely related species that grow in shady, mesic forests of tropical and subtropical regions.

282. *Oplismenus burmannii* (Retz.) P. Beauv., Ess. Agrostogr. 54: 169. 1812. *Panicum burmannii* Retz., Observ. Bot. 3: 10. 1783.

Annual; usually slender. Culms (15)25–45(65) cm tall; nodes hairy; internodes grooved, usually hairy in the grooves, less so on the nodes. Leaves light green; sheaths glabrous or sparsely hairy, the edges ciliate; ligules 0.6-1.2(1.8) mm long, ciliate; blades (2)3–7(8) cm long, 6–13 (16) mm wide, ovate-oblong to oblonglanceolate, usually hairy, midvein weak, with 2-3 lateral veins on each side, cross venation usually visible. Panicles (3)4-8(10) cm long, sometimes hairy, with 3-10 primary branches; lower primary branches (0.2)0.5-1.5(3) cm long, with (3)10-20(25) spikelets, spikelets borne in pairs, usually encircled at the base with hairs almost as long as the spikelets. Spikelets (2)2.8-4.5 mm long, usually densely hairy, sometimes glabrous, flattened to rounded on the back; lower glumes (1.3)1.9-2.4 mm long, 0.7-0.9(1.2) mm wide, oblong-oval, densely hairy, with 3-5(7) veins, awned, the awns (3)6-11(15) mm long, frail, whitish, and scabrous; upper glumes (1.5)2-2.3 mm long, (0.7)-1.2(1.5) mm wide, similar to the lower glumes in shape, fairly densely hairy, with 5-7 veins, awned, the awns (0.4)3-6(9) mm long, frail, whitish, and scabrous; **lower lemmas** (2)2.6–3.5 mm long, (1)1.7–2.4 mm wide, oblong, with (5)7-9(11) veins, mucronate or shortawned; lower paleas absent. Caryopsis oblong-lanceolate.

Oplismenus burmannii is a pantropical species that is most abundant in Africa. In Mexico it has two varieties: O. burmanii var. burmanii and O. burmannii var. nudicaulis (McVaugh, 1983), and only the former variety is known from Chihuahua. However, we include a key to both varieties since O. burmanii var. nudicaulis is known from eastern Sonora near the boundary of Chihuahua (P.M. Peterson & Saarela 22107).

KEY TO VARIETIES OF OPLISMENUS BURMANNII

Oplismenus burmannii var. burmannii

DISTRIBUTION AND HABITAT. Oplismenus burmannii var. burmannii is known from Mexico to South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua.
Chinipas: Saguarivo, 53 mi N of Alamos, 9 Sep 2008, slopes

with oaks and pines, 1540 m, P.M. Peterson & J.M. Saarela 22122 (US). Ocampo: Parque Nacional "Cascada de Basaseachic," in the barranca [canyon] to W of falls, 4 Oct 1986, 1800 m, Spellenberg, Soreng, R. Corral & T. Lebgue 8826 (NMC).

Otatea (McClure & E. W. Sm.) C. E. Calderón & Soderstr.

Perennial bamboos of medium size, clump-forming with pachymorph rhizomes. Culms woody, erect, internodes cylindrical, solid becoming partially fistulose, glabrous, branches 3 per node at the middle of the culm. Sheaths persistent on the lower nodes, tardily deciduous on the upper nodes; ligules membranous, auriculate; blades lanceolate, flat, the blades of branches with pseudopetioles. Inflorescence a panicle; spikelets with several florets; glumes 1 or 2, short-awned; florets bisexual; upper florets reduced; rachilla internodes scabrous, ciliolate; lemma awned; palea with a dentate apex. Fruit a small, dry caryopsis.

Otatea has 11 species known from tropical areas, 10 are endemic to Mexico, and 1, O. fimbriata Soderstr., is wide ranging from Mexico and Central America to Columbia (Juziewicz et al., 1999; Ruiz Sanchez et al., 2011, 2015; Ruiz Sanchez and Castro Castro 2016).

283. Otatea acuminata (Munro) C. E. Calderón & Soderstr., Smithsonian Contr. Bot. 44: 21. 1980. Arundinaria acuminata Munro, Trans. Linn. Soc. London 26(1): 25. 1868.

Rhizomatous perennial. Culms 2–10 m tall, 1–2.5 cm thick, erect, solid on young plants and fistulose on mature individuals; internodes green-yellowish or purple. Leaves cauline; sheaths appressed-hirsute on the upper ½, setose on the shoulders, the hairs about 3 mm long; ligules 0.3-0.6 mm long, truncate; blades 6-15 cm long, 0.5-1.1 cm wide, linear to narrowly lanceolate, glabrous adaxially, abaxially pilose near the base, deciduous at the ligule. Panicles 5-10 cm long; pedicels glabrous. Spikelets 3–4 cm long, 3- to 7-flowered; rachilla internodes 4–7 mm long, zigzag, visible between the lemmas and disarticulating at maturity, pubescent; glumes unequal, awned, the awns 1–3 mm long; lower glumes 2.5–4.5 mm long excluding the awn; upper glumes 3.5-6 mm long; lemmas 11-15 mm long, 9- to 11-veined, pilose on margins, lanceolate, keeled with a terminal awn, the awn 3–6 mm long; paleas 9-11 mm long, oblong, pubescent on the keels and between, apex truncate and narrow; anthers 5-6.5 mm long. Caryopsis 6–8.5 mm long, linear.

There are two subspecies; only *Otatea acuminata* subsp. *aztecorum* (McClure & E. W. Sm.) R. Guzmán, Anaya & Santana is present in Chihuahua.

DISTRIBUTION AND HABITAT. Otatea acuminata subsp. aztecorum grows in wet places in tropical forests and is endemic to the Mexican Pacific slopes, the Trans-Mexican

Volcanic Belt, Oaxaca, Puebla, Querétaro, and Veracruz at 150-2,000 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: 37.3 km al NE de Batopilas, rumbo [course] a Quirare, 26 Oct 2002, 1860 m, *P. Tenorio & J. Rodríguez 22429* (US). Panicum L.

Annual or perennial. Culms herbaceous, sometimes hard and almost woody, or woody, simple or branched, bases not cormlike; internodes solid, spongy, or hollow. Leaves cauline, basal, or both, basal leaves not forming a winter rosette; ligules membranous, usually ciliate; blades filiform to ovate, flat to involute, glabrous or hairy. Inflorescence terminal on the culms and branches, sometime axillary, terminal panicles typically appearing after midsummer; sterile branches and bristles absent; disarticulation usually below the glumes, sometimes at the base of the upper florets, if at the base of the upper florets, then the florets not very plump at maturity. Spikelets dorsally compressed, sometimes subterete or laterally compressed, awnless. Glumes usually unequal, herbaceous, glabrous or hairy, rarely tuberculate or glandular, apex not or only slightly gaping at maturity; lower glumes minute to almost equaling the spikelets, 1- to 9-veined, truncate, acute, or acuminate; upper glumes slightly shorter to much longer than the spikelets, 3- to 13(15)-veined, bases rarely slightly sulcate, apex rounded to attenuate; lower florets sterile or staminate; lower lemmas similar to the upper glumes; lower paleas absent or shorter than the lower lemmas and hyaline; upper floret bisexual, 3/3 to as long or exceeding the upper glume, sessile or stipitate, apex acute, glabrous or hairy; upper lemmas usually more or less rigid and chartaceousindurate, usually shiny, glabrous, and smooth, sometimes pubescent, sometimes verrucose or faintly transversely rugose, margins involute, usually clasping the paleas, rarely with basal wings or lunate scars, apex obtuse, acute, apiculate, or occasionally with small green crests; upper paleas striate, rarely transversely rugose; lodicules 2; anthers usually 3. Caryopsis smooth; pericarp thin; endosperm hard, without lipid, starch grains simple or compound, or both; hila round or oval. x = 9 (usually), sometimes 10, with polyploid and dysploid derivatives.

Panicum has approximately 330 species of cosmopolitan distribution.

KEY TO SPECIES OF PANICUM

- 1. Plants robust, greater than 1 m tall; plants perennial and generally rhizomatous; cultivated in pastures.

 - 2. Culms with bases not knotty; nodes and internodes of similar diameter; spikelets 3-4 mm long, not in pairs.

3. Upper florets rugulose, elliptical, minutely puberulent at the apex; lower glume less than ½ as long as the spikelet, 3. Upper florets smooth, ovate, glabrous; lower glume more than ½ as long as the spikelet, acuminate, 3- to 5-veined; 1. Plants not robust, less than 1 m tall; annual or perennial but never rhizomatous; never cultivated in pastures. 4. Spikelets 2 mm long or more; perennial or appearing annual. 5. Spikelets 3.7–5.8(6) mm long; upper glume and lemma 11–15-veined; culms erect, not geniculate. 6. Spikelets 3.7-4.2 mm long; panicle branches spreading and flexuous, naked near base with 1 to 3 spikelets near the tips P. lepidulum 6. Spikelets 4.5-6 mm long; panicle branches ascending or spreading, never flexuous, branches few-flowered or floriferous to base. 7. Lower glumes 2-2.7 mm long, acute or obtuse; rachilla between the glumes inconspicuous; panicle branches 7. Lower glumes 2.8-4.2 mm long, acuminate; rachilla between the glumes elongate; panicle branches few-5. Spikelets 2-3.5(4) mm long (4 mm in *P. pampinosum*); upper glume and lemma 7- to (9)-veined (lemma 9-veined in P. pampinosum); culms decumbent and geniculate. 8. Lower glume ¼ to ⅓ as long as the spikelet, apex obtuse to acute. 8. Lower glume ½ or more as long as the spikelet, apex acute or acuminate. 10. Annual, culms usually not hardened at the base; blades papillose-hirsute to pilose at least on the base and 11. Panicle spiciform to subspiciform, the primary branches appressed to ascending P. pampinosum 11. Panicle lax, diffuse to contracted, the primary branches divergent. 12. Upper floret short stipitate with 2 cartilaginous extensions at the base of the lemma; blades glabrous

284. *Panicum alatum* Zuloaga & Morrone, Ann. Missouri Bot. Gard. 83(2): 224–226, f. 15, 1996.

Caespitose annual. Culms 25-95 cm tall, erect to geniculate, branched at base, generally glabrous. Leaf sheaths pappilose-hirsute with deciduous hairs; ligules 0.7–1.8 mm long, membranous, ciliate, the cilia 0.5-1.5 mm long; blades 5-18 cm long, 3-17 mm wide, flat, linear-lanceolate, glabrous to sparsely papillose-hirsute, the base rounded to subcordate. Panicles 5-25 cm long, terminal and axillary, diffuse; branches 4.5-12 cm long, lax, ascending to divergent; rachis scabrous. Spikelets 2.4-3.5 mm long, 0.7-1.5 mm wide, elliptic, glabrous, acute to acuminate; lower glume 1.5-1.8(2.5) mm long, 34 as long as the spikelet, 5- to 7-veined, ovateacuminate, separated from the upper glume by an internode of 0.3 mm long; upper glume 2.2-2.7(3.3) mm long, 7- to 9(11)-veined; lower floret neuter; inferior lemma similar to the upper glume; inferior palea lacking, or if present 0.2-0.9 mm long, lanceolate, bilobed; upper floret perfect, short stipitate with 2 cartilaginous extensions at the lemma base, whitish, opaque, markedly papillose over the entire surface or only at apex; palea oblong-ovate, apex abruptly acute; anthers 0.9–1.1 mm long. n = 9.

DISTRIBUTION AND HABITAT. Panicum alatum occurs in open areas, sometimes at lake margins. This taxon has

three varieties; *Panicum alatum* var. *minus* (Anderson) Zuloaga & Morrone is reported from Chihuahua (Espejo Serna et al., 2000) and ranges from the United States to South America. It was described from Baja California but is uncommon in Mexico.

285. Panicum antidotale* Retz., Observ. Bot. 4: 17. 1786.

Caespitose perennial; rhizomatous, the rhizomes about 1 cm thick, knotted, pubescent, with large, scalelike leaves. Culms 50-300 cm tall, 2-4 mm in diameter, often compressed, erect or ascending, hard, becoming almost woody; nodes swollen, glabrous or pubescent; internodes glabrous and glaucous. Sheaths shorter than or equal to the internodes, not keeled, glabrous or the lower sheaths at least partially pubescent, the hairs papillose-based; ligules 0.3-1.5 mm long; blades 10-60 cm long, 3-20 mm wide, elongate, flat, scabrous below and along margins, occasionally pubescent above near the base with prominent, white midveins, bases rounded to narrowed. Panicles 10-45 cm long, ½ as wide as long, open or somewhat contracted with many spikelets; branches 4-12 cm long, ascending to spreading, inserted opposite or alternately along the rachis; pedicels 0.3-2.5 mm long, scaberulous to scabrous, appressed to diverging less than 45° from the branch axes. Spikelets 2.4–3.4 mm long, 1–1.3 mm wide, ellipsoid-lanceoloid to narrowly ovoid, often purplish, glabrous, acute; lower glumes 1.4–2.2 mm long, $\frac{1}{3}$ as long as the spikelets, 3- to 5-veined, obtuse; upper glumes and lower lemmas subequal, glabrous, 5- to 9-veined, margins scarious, acute; lower florets staminate; upper florets 1.8–2.8 mm long, 0.9–1.1 mm wide, smooth, lustrous, acute. 2n = 18, 36.

DISTRIBUTION AND HABITAT. Panicum antidotale is found on grassy flats and is cultivated at Rancho La Campana. This species is native to India and has been introduced to the Western Hemisphere.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Rancho Experimental La Campana, 82 km al N de la ciudad de Chihuahua, 26 Aug 1978, 1550 m, *C.A. Fernández s.n.* (ENCB); La Campana, 24 Sep 1976, Jardín de observación forrajera [forage observation garden], 1500 m, *S. González 769* (RELC).

286. *Panicum decolorans* Kunth, Nov. Gen. Sp. (quarto ed.) 1: 100. 1815.

Caespitose annual. Culms 30-60 cm tall, internodes distally pilose. Sheaths hirsute with tubercle-based hairs; ligules 1 mm long, a ciliolate membrane; blades 8-15 cm long, 7-10 mm wide. Panicles 10-18 cm long with branches floriferous throughout, ascending and appressed, somewhat narrow. Spikelets 4.5-6 mm long, ovate, dorsally compressed, acute, falling entire, pedicelled; glumes as long as the florets, unequal, ovate, membranous, thinner than fertile lemma, apex acute; lower glumes 2-2.7 mm long, 5- to 7-veined, acute to obtuse; upper glume 4.5-6 mm similar to lemma of the sterile floret; lemma of sterile floret as long as the spikelet, ovate, membranous, acute; sterile floret palea ¼ as long as the lemma; fertile lemma 2.3-3.5 mm long, 1.5 mm wide, elliptic, dorsally compressed, indurate, pallid, shiny, margins involute; fertile palea involute, indurate; anthers 2.1 mm long, dark brown. Caryopsis 2-2.5 mm long. n = 16, 18.

DISTRIBUTION AND HABITAT. Panicum decolorans grows in grasslands. It is endemic to Mexico, from Chihuahua, Durango, Guanajuato, Hidalgo, Jalisco, México, Michoacán, Oaxaca, Puebla, Querétaro, Sinaloa, and San Luis Potosí (Espejo Serna et al., 2000; Herrera Arrieta and Cortés Ortiz, 2010).

287. Panicum dichotomiflorum* Michx., Fl. Bor.-Amer. 1: 48. 1803.

Annual or short-lived perennial; usually terrestrial, sometimes aquatic but not floating. Culms 5–200 cm tall, 0.4–3 mm thick, decumbent to erect, commonly geniculate to ascending, rooting at the lower nodes when in water, simple to divergently branched from the lower and middle nodes, usually succulent, slightly compressed, glabrous; nodes usually swollen, sometimes constricted on robust plants, glabrous; internodes glabrous, shiny, pale green to purplish. Sheaths compressed, inflated, sparsely pubescent near the base, elsewhere mostly glabrous, sparsely pilose, or hispid,

hairs sometimes papillose-based, margins or throat ciliate with papillose-based hairs; ligules 0.5-2 mm long; blades 10-65 cm long, 3-25 mm wide, glabrous or sparsely pilose, often scabrous near the margins, midribs stout, whitish. Panicles 4-40 cm long, diffuse, lax, with a few spikelets; branches to 15 cm long, ascending to spreading, stiff, scabrous, alternate or opposite, occasionally verticillate; pedicels 1-6 mm long, sharply 3-angled, scabrous, apex expanded to cuplike, appressed mostly to the abaxial side of the branches. Spikelets 1.8-3.8 mm long, 0.7-1.2 mm wide, ellipsoid to narrowly ovoid, light green to red-purple, glabrous, acute to acuminate; lower glumes 0.6-1.2 mm long, 1/4-1/3 as long as the spikelets, 0- to 3-veined, obtuse to acute; upper glumes and lower lemmas similar, exceeding the upper florets by 0.3-0.6 mm long, 7- to 9-veined; lower paleas vestigial to almost as long as the lower lemmas; lower florets sterile; upper florets 1.4–2.5 mm long, 0.7–1.1 mm wide, narrowly ellipsoid, smooth, shiny, stramineous to nigrescent, with pale veins. 2n = 36, 54.

DISTRIBUTION AND HABITAT. Panicum dichotomiflorum grows in open, often wet, disturbed areas such as cultivated and fallow fields, roadsides, ditches, open stream banks, receeding shores, clearings in flood plain woods, and sometimes in shallow water. It is probably native throughout the eastern United States and adjacent Canada but introduced elsewhere. This species is reported for Chihuahua in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

288. Panicum hallii Vasey, Bull. Torrey Bot. Club 11(6): 61. 1884.

FIGURE 185

Caespitose perennial. Culms 10-100 cm tall, 2-10 mm thick, erect, simple or sparingly branched basally; nodes sericeous, pilose or glabrous; internodes usually glaucous. Leaves often crowded basally; sheaths rounded, glabrous or hirsute, hairs fragile, papillose-based, margins sometimes ciliate distally; ligules 0.6-2 mm long; blades 4-23 cm long, 1-10 mm wide, erect to spreading, flat or sometimes involute (on sterile branches), often curling at maturity, glaucous, abaxial surfaces sometimes with prominent papillae along the midribs, bases rounded or narrowing to the sheaths, margins cartilaginous, ciliate basally, scaberulous elsewhere, apex acute. Terminal panicles 7-31 cm long, 3-15 cm wide; rachises glabrous, tending to break at maturity; branches usually alternate, slender, stiff, ascending to divergent; pedicels 1-15 mm long, appressed. Spikelets 2.1-4.2 mm long, 0.8-1 mm wide, usually ovoid, glabrous; lower glumes 1.2-2.4 mm long, ½-¾ as long as the spikelets, attenuate; upper glumes and lower lemmas similar, 7- to 11-veined, acuminate, extending 0.3–1.2 mm beyond the upper florets; lower florets sterile; lower paleas 0.8-2 mm long; upper florets 1.5-2.4 mm long, 0.7-1.2 mm wide, ovoid to ellipsoid, smooth, nigrescent. 2n = 18.

DISTRIBUTION AND HABITAT. *Panicum hallii* grows on sandy, gravelly, or rocky land, including roadsides, pastures, rangeland, oak and pine savannahs, chaparral, and moist

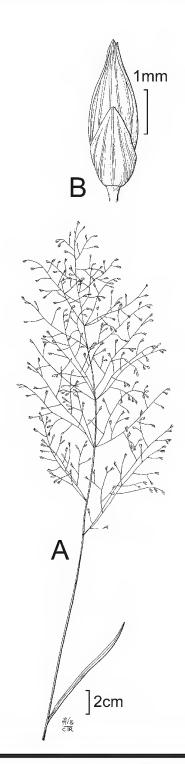

FIGURE 185. *Panicum hallii*. A. Culm and inflorescence. B. Spikelet. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

areas in deserts and on mesas. Its range extends from the southwestern United States to Guatemala.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: 10 km al S de Moctezuma, 30 Jul 1994, 1200 m, R. Corral, E. Pérez, A. Domínguez & F. Félix RCD5337 (UACJ). 289. *Panicum birticaule* J. Presl, Reliq. Haenk. 1(4–5): 308. 1830.

FIGURE 186

Annual. Culms 11-110 cm long, erect to decumbent; nodes short hirsute or glabrous. Sheaths shorter than the internodes, greenish to purplish, glabrous or with papillose-based hairs, ciliate on 1 margin, glabrous on the other; collars hirsute; ligules 1.5-3.5 mm long, of hairs; blades 3-30 cm long, 3-30 mm wide, flat, usually densely to sparsely hirsute, hairs papillosebased, sometimes glabrous, bases rounded to cordate-clasping, margins ciliate, cilia papillose-based, apex acute. Panicles 9-30 cm long, 5-8 cm wide, erect or nodding, partially included to well-exserted, rachises glabrous or sparsely hirsute basally; primary branches usually alternate to opposite, divergent, secondary branches and pedicels confined to the distal ²/₃; pulvini inconspicuous; secondary branches appressed; pedicels 9-27 mm long, appressed. Spikelets 1.9-4 mm long, 0.8-1 mm wide, ovoid to almost spherical, often reddish-brown, glabrous, veins prominent, scaberulous, apex abruptly acuminate; lower glumes 1.3-2.4 mm long, ½-¾ as long as the spikelets, 3- to 5-veined; upper glumes 1.8-3.3 mm long, 7- to 11-veined; lower florets sterile; lower lemmas similar to the upper glumes, 9-veined; lower paleas 0.4-0.9 mm long; upper florets 1.5-2.4 mm long, 0.4-0.8 mm wide, ellipsoid, smooth or conspicuously papillate, shiny, stramineous, often with a lunate scar at the base.

DISTRIBUTION AND HABITAT. Panicum hirticaule grows in rocky or sandy soils in waste places, roadsides, ravines, and wet meadows along streams. Its range extends from southeastern California and southwestern Texas southward through Mexico, Central America, Cuba, and Hispaniola to western South America and Argentina. Two varieties are known from Chihuahua (Zuloaga and Morrone 1996).

290. *Panicum lepidulum* Hitchc. & Chase, Contr. U.S. Natl. Herb. 15: 75, f. 64. 1910.

Perennial; solitary or caespitose. Culms 25–70(100) cm tall, erect, with 1 or 2 per plant, sparsely papillose-pilose to scabrous toward the apex. Leaf sheaths papillose-hirsute with ascending hairs; ligules 1.8–2 mm long, membranous; blades 7–20(30) cm long, 5–10 mm wide, flat or conduplicate, sparsely pilose. Panicles 10–20(30) cm long, terminal, largely exserted, ovoid, the branches ascending and flexuous with 1–3 spikelets near the tips, naked below. Spikelets 3.7–4.2 mm long, 1.3–1.5 mm wide, narrowly ovate, turgid, apex acuminate; lower glumes 1.7–2.7 mm long, ovate, 5-veined, the midvein scabrous to the apex, acute or acuminate; upper glumes 3.7–4.2 mm long, apiculate; lower floret sterile, lower lemma similar to the upper glume, lower palea 1.5 mm long; upper floret perfect. Caryopsis 3.2–3.8 mm long, 1.2–1.4 mm wide, oval, turgid and obtuse, pale, glabrous, smooth, bright.

DISTRIBUTION AND HABITAT. Panicum lepidulum grows in grasslands, xerophilous scrub, and pine–oak forests. It ranges from Mexico in Chihuahua, Distrito Federal, Durango, Guanajuato, Jalisco, Michoacán, Morelos, and Oaxaca to Central America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. near Chihuahua, Aug 1885, C.G. Pringle 497 (US).

291. *Panicum pampinosum* Hitchc. & Chase, Contr. U.S. Natl. Herb. 15: 66, f. 48. 1910.

Caespitose annual. Culms 12–30 cm long, erect, decumbent, glabrous, with branches on central and inferior nodes; nodes hairy, the hairs white and silky about 1 mm long. Leaf sheaths papillose-pilose, collar glabrous; ligules 1 mm long, membranous; blades 3-12 cm long, 3-10 mm wide, flat, linear-lanceolate, with short hairs or hispid, margins pilose toward base, base rounded to subcordate. Terminal panicles 5-6 cm long, axillary panicles 2-3 cm long, contracted, spiciform to subspiciform, generally exserted, few-flowered, often the spikelets clustered near the end of the branches; primary branches 4-8 cm long, appressed and ascending, alternate; pulvinus glabrous; rachis glabrous ot scabrous. Spikelets 3.6-4 mm long, 1.4 mm wide, globose, glabrous, acute; lower glumes 2.4-3.1 mm long, 3- to 5-veined, acuminate; upper glumes 3.6-4 mm long, 7-veined; lower lemma sterile, similar to the upper glume, 9-veined; lower paleas 1.2-1.4 mm long, glabrous; upper floret 2-2.4 mm long, 1.2 mm wide, obovate to globose, smooth, lustrous, with 2 basal scars, the scars 0.3 mm long. n = 9, 18.

DISTRIBUTION AND HABITAT. Panicum pampinosum grows in grasslands and open areas; it ranges from the United States to Mexico.

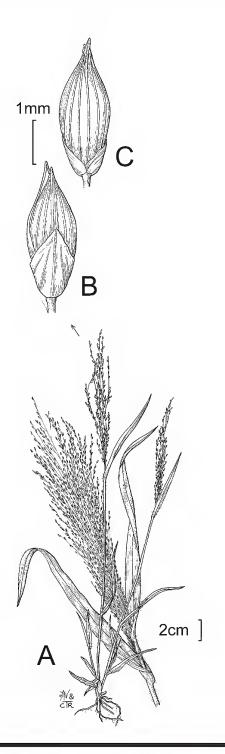

FIGURE 186. Panicum hirticaule var. hirticaule. A. Habit. B. Spikelet showing lover glume. C. Spikelet showing upper glume. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

292. *Panicum parcum* Hitchc. & Chase, Contr. U.S. Natl. Herb. 15: 68, f. 53. 1910.

Caespitose annual. Culms 30–90 cm tall, erect to geniculate, simple or branched on lower and middle nodes, glabrous. Leaf sheaths papillose-hispid; ligules 0.6–1.5 mm long, membranous, ciliate, the cilia 0.5–1 mm long; blades 10–25 cm long, 3–10 mm wide, linear, flat, papillose-pilose, ciliate, rounded on base. Panicles 7–35 cm long, open, lax, few-flowered, terminal and axillary; primary branches 9–18 cm long, scabrous, spreading; spikelets divergent, solitary at the end of the branches. Spikelets 4.8–5.8 mm long, ovoid, glabrous, acuminate; lower glumes 2.8–4.2 mm long, clasping near base, 5- to 7-veined, acuminate, glumes internode elongated; upper glumes 4.8–5.8 mm long, 9-to 11-veined, acuminate; lower palea 1.5–2.5 mm long; upper floret perfect; upper lemma 2.8–3.4 mm long, 1.5–2 mm wide, smooth, bright, glabrous, obtuse, sessile; anthers 1.4–2 mm long. Caryopsis 2.3–2.5 mm long, whitish. 2n = 36.

DISTRIBUTION AND HABITAT. *Panicum parcum* grows in grasslands, it occurs in Mexico and Central America. This species is reported in Espejo Serna et al. (2000) and Herrera Arrieta and Cortés Ortiz (2010).

293. *Panicum plenum* Hitchc. & Chase, Contr. U.S. Natl. Herb. 15: 80. 1910.

FIGURE 187

Rhizomatous perennial. Culms 70-150 cm tall, decumbent, simple, glaucous; internodes flattened, glabrous. Leaf sheaths glabrous to appresed-pilose; ligules 0.5-1.2 mm long, membranous, ciliate, the cilia 0.2–0.7 mm long; blades 10–30 cm long, 4–8 mm wide, linear, flat, broadened to subcordate neare base, glabrous or scaberulous. Panicles 10-30 cm long, about 3/3 as wide, open, all terminal; branches 4-10 cm long, ascending to spreading, solitary. Spikelets 3-3.4 mm long, 1.2-1.4 mm wide, ellipsoid or lanceolate, glaucous, some purplish, solitary, acute to subacute; lower glumes 1-1.2 mm long, less than ½ as long as the spikelet, subacute, 3-veined; upper glumes 3-3.4 mm long, 5- to 7-veined, obtuse; lower floret sterile or staminate; lower lemma 3-3.4 mm long, 5- to 7-veined, subacute; lower palea shorter than the lower lemma; anthers 2-2.7 mm long; upper floret perfect, rugulose, elliptic, minutely puberulent near the apex, acute; upper lemma 3–3.2 mm long, 1.1–1.3 mm wide; anthers 2.1–2.8 mm long.

DISTRIBUTION AND HABITAT. Panicum plenum grows in oak forests and occurs in the United States and Mexico in Chihuahua, Durango, Guerrero, Morelos, Sonora, and Veracruz.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: 14 Oct 1910, *Hitchcock* 7772 (US); 6 mi N of Chihuahua, 8 Oct 1959, *Soderstrom* 923 (US). Jiménez: Sta. Eulalia plains, 8 Sep 1885, *E. Wilkinson* 51, 60 (US).

294. Panicum trichoides Sw., Prodr. 24, 1788.

FIGURE 188

Annual. Culms 15-100 cm tall, 0.5-1(2) mm thick, sprawling to erect, without cormlike bases, freely branching and rooting from the lower nodes; nodes prominent, glabrous or pubescent; internodes not succulent, pilose. Sheaths shorter than the internodes, rounded, with papillose-based hairs; collars pilose; ligules 0.2-0.5 mm long; blades 2-7 cm long, 5-20 mm wide, 4–6 times longer than wide, lanceolate, thin, flat, sparsely to densely pilose, the hairs papillose-based; bases asymmetrical, cordate to subcordate; lower margins ciliate, papillose. Panicles 4-24 cm long, almost as wide as long, diffuse, partially included or exserted; primary branches to 10 cm long, ascending to reflexed, branching in the distal 3, alternate; pedicels 9-20 mm long, threadlike. Spikelets 1-1.4 mm long, 0.5-0.6 mm wide, not secund, lanceolate to narrowly ovoid, plano-convex in side view, sparsely pubescent; lower glumes 0.4-0.8 mm long, 1/3-1/2 as long as the spikelets, 1- to 3-veined, subacute; upper glumes 0.8-1.2 mm long, arising 0.2 mm above the lower glumes, 3- to 5-veined; lower florets sterile; lower lemmas 0.1-0.2 mm longer than the upper glumes, 3- to 5-veined; lower paleas 0.5-0.8 mm long, hyaline; upper florets 0.8–1.2 mm long, 0.4–0.6 mm wide, finely rugose; lemmas strongly convex. 2n = 18.

DISTRIBUTION AND HABITAT. *Panicum trichoides* grows in moist, often weedy fields, woodlands, and savannahs in Mexico, Central America, and the Caribbean

295. Panicum vaseyanum Scribn. ex Beal, Grass. N. Amer. 2: 140. 1896.

Caespitose annual. Culms 30–70 cm tall, ascending or suberect from a decumbent base, rooting at the lower nodes. Leaf sheaths shorter than the internodes, inflated below, glabrous, often exposing the culms with age; ligule 0.5–1.5 mm long, membranous, white, pilose, the hairs 0.4–1.4 mm long; blades 5–20 cm long, 3–7 mm wide, flat, conduplicate on base, glabrous. Panicles 4–7 cm long, narrow, terminal and axillary;

branches 1–4 cm long, 3–5 per rachis, the lower reflexed at maturity, the upper appressed. Spikelets 2.2–3.2 mm long, solitary, appressed, ellipsoid, subacute; lower glumes 0.9–1.2 mm long, almost ½ as long as the spikelet, obtuse to acute, clasping below; upper glumes slightly shorter than the lower lemma, 7-veined, acute; lower floret sterile; lower lemma 2.2–3.2 mm long; lower palea absent; upper floret perfect; anthers 1.1–1.9 mm long. Caryopsis 2–2.7 mm long, 1–1.2 mm wide, smooth, bright, glabrous, olive-green to brown, acute.

DISTRIBUTION AND HABITAT. Panicum vaseyanum grows in grasslands and oak forests. It occurs in Mexico in Aguascalientes, Chiapas, Chihuahua, Distrito Federal, Guanajuato, Guerrero, Jalisco, México, Michoacán, and Querétaro.

296. *Panicum virgatum* L., Sp. Pl. 1: 59. 1753. *Panicum havardii* Vasey.

FIGURE 189

Rhizomatous perennial; the rhizomes often loosely interwoven, hard, with closely overlapping scales, sometimes short or forming a knotty crown. Culms 40-300 cm tall, 3-5 mm thick, solitary or forming dense clumps, erect or decumbent, usually simple; nodes glabrous; internodes hard, glabrous or glaucous, green or purplish. Sheaths longer than the lower internodes, shorter than internodes above, glabrous or pilose, especially on the throat, margins usually ciliate; ligules 2-6 mm long; blades 10-60 cm long, 2-15 mm wide, flat, erect, ascending or spreading, glabrous or pubescent, adaxial surfaces sometimes densely pubescent, particularly basally, bases rounded to slightly narrowed, margins scabrous. Panicles 10-55 cm long, 4-20 cm wide, exserted, open; primary branches ascending to spreading, scabrous, usually rebranching once, thin, straight, solitary to whorled or fascicled; pedicels 0.5-20 mm long, appressed to spreading. Spikelets 2.5-8 mm long, 1.2-2.5 mm wide, narrowly lanceoloid, turgid to slightly laterally compressed, glabrous, acuminate; lower glumes 1.8-3.2 mm long, ½-4/5 as long as the spikelets, glabrous, 5- to 9-veined, acuminate; upper glumes and lower lemmas extending 0.4-3 mm beyond the upper florets, 7- to 11-veined, strongly gaping at the apex; lower florets staminate; lower paleas 3-3.5 mm long,

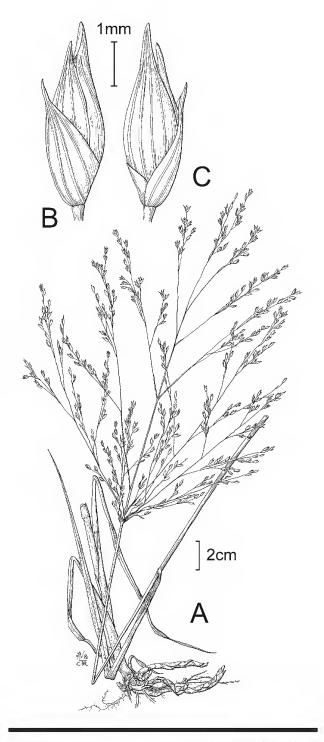

FIGURE 189. Panicum virgatum. A. Habit. B. Spikelet showing lower glume below. C. Spikelet showing upper glume. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

ovate-hastate, lateral lobes folded over the anthers before anthesis; upper florets 2.3-3 mm long, 0.8-1.1 mm wide, narrowly ovoid, smooth, glabrous, shiny; upper lemmas clasping the paleas only at the base. 2n = 18, 21, 25, 30, 32, 35, 36, 54-60, 67-72, 74, 77, 90, 108.

DISTRIBUTION AND HABITAT. *Panicum virgatum* grows in tall grass prairies on dry slopes and sandy sites in open oak or pine woodlands and along shores, river banks, and brackish marshes. Its range extends from southern Canada throughout the United States to Mexico, Cuba, Bermuda, and Costa Rica; possibly introduced in Argentina.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: El Plan RELAC, 26 Mar 83, pastizal [pastureland], 1300 m, *G. Melgoza 130* (RELC). Pappophorum Schreb.

Perennial; caespitose, essentially glabrous throughout. Culms 30–130 cm tall. Sheaths open; ligules of hairs; micro hairs of the blades with an inflated terminal cell similar in length to the basal cell. Inflorescence terminal, narrow, spikelike or somewhat open panicle; disarticulation above the glumes but not between the florets, these falling together. Spikelets with 3–5 florets, only the lower 1–3 bisexual; glumes subequal, thin, membranous, 1-veined, acute; lemmas rounded on the back, hairy at least basally, obscurely (5)7(9)-veined, veins extending into scaberulous awns of unequal length, several additional narrow awn-like lobes usually also present, awns and lobes together forming a pappuslike crown; paleas textured like the lemmas, 2-veined, 2-keeled, keels scabrous or hairy; anthers 3; styles 2. Caryopsis elliptical, plump, slightly dorsally flattened or nearly terete; embryos about ½ as long as the caryopsis. x = 10.

Pappophorum is an American genus with nine species. It grows in warm regions of North and South America.

KEY TO SPECIES OF PAPPOPHORUM

297. Pappophorum bicolor E. Fourn., Mexic. Pl. 2: 133. 1886.

Perennial. Culms 30–80(100) cm tall. Sheaths mostly glabrous, apex with a tuft of hairs on either side; ligules about 1 mm long; blades 10–20(30) cm long, 2–5 mm wide, flat to involute. Panicles 12–20 cm long, narrow but usually with some slightly spreading branches, pink or purple-tinged. Spikelets with the lower 2 or 3 florets bisexual, distal 1 or 2 florets sterile; glumes 3–4 mm long, thin, glabrous, apex acute or minutely notched and mucronate; lemmas somewhat firm, usually faintly 7-veined, with 11–15 awns; lowest lemma bodies 3–4 mm long, midveins and margins pubescent from the base to about midlength, awns about 1.5 times as long as the lemma bodies; paleas subequal to the lemma bodies or slightly longer. Caryopsis about 2 mm long. 2n = 100.

DISTRIBUTION AND HABITAT. *Pappophorum bicolor* grows in open valleys, road rights-of-way, and grassy plains in Texas and northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Aldama: Santo Domingo, 50 km SW of Coyame of Mex 16 between Presidio, Texas and Chihuahua, 22 Sep 1988, 1400 m, P.M. Peterson & Annable 5753 (US); km 38 carr. 298. *Pappophorum vaginatum* Buckley, Prelim. Rep. Surv. Texas App. 1. 1866.

Perennial. Culms (40)50–100 cm tall. Sheaths mostly glabrous, with a tuft of hairs at the throat; blades 10-25 cm long, 2-5 mm wide, flat to involute, adaxial surfaces scaberulous. Panicles 10-25 cm long, tightly contracted, usually white or tawny, rarely slightly purple-tinged. Spikelets with 1(2) bisexual florets and 2 reduced florets; glumes (3)4–4.5 mm long, glabrous, acute; lowest lemma bodies 3-3.2 mm long, midveins and margins pubescent from the base to about midlength, awns about twice as long as the lemma bodies, tending to spread at right angles when mature; paleas longer than the lemma bodies. 2n = 60.

DISTRIBUTION AND HABITAT. Pappophorum vaginatum grows in similar habitats to P. bicolor, the two species sometimes growing together. Its range extends from southern Arizona to Texas and northern Mexico and from Uruguay to Argentina.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Aldama: Santo Domingo, 50 km SW of Coyame of Mex 16 between Presidio, Texas and Chihuahua, 22 Sep 1988, 1400 m, *P.M. Peterson & Annable 5752* (US); 26 (rd) mi NE of Aldama along Hwy

16 near El Morrion, 15 Sep 1972, 1400 m, *J. Henrickson 7563* (MEXU, NMC); 60 km Chih–Ojinaga, matorral [scrub], 1270 m, *Molinar, Rodríguez & Baray 150* (MEXU). Chihuahua: Rancho La Campana, 24 Sep 76, Jardines de observación [observation gardens], 1500 m, *S. González 822* (RELC); Rancho Experimental La Campana, 82 km al N de Chihuahua, 26 Aug 1978, pastizal [pastureland], 1500 m, *M.A. Bernal s/n* (MEXU). Delicias: 14 km N of Delicias road from Chihuahua to Delicias, 29 Jun 1974, weedy vegetation in irrigated area, *S.D. Koch 74156* (ENCB, MEXU). Jiménez: 39 mi N of Ceballos on Mex 49, 31 Mar 1971, mesquite along hwy, 3950 ft, *W.E. Harmon 5431* (ENCB).

Paspalum L.

Annual or perennial; caespitose, rhizomatous or stoloniferous. Culms erect, spreading or prostrate, sometimes trailing. Sheaths open; auricles sometimes present; ligules membranous. Inflorescences terminal, sometimes also axillary, panicles of 1 to many spikelike branches, these digitate or racemose on the rachis, spreading to erect, 1 or more branches completely or partially hidden in the sheaths in some species; branch axes

flattened, usually narrowly to broadly winged, usually terminating in a spikelet, sometimes extending beyond the distal spikelet but never forming a distinct bristle; disarticulation below the glumes. Spikelets subsessile to shortly pedicellate, plano-convex, rounded to acuminate, dorsally compressed, not subtended by bristles or a ring-like callus, solitary or paired (1 spikelet of the pair reduced in some species), in 2 rows along 1 side of the branch, with 2 florets, first rachilla segment not swollen, upper glumes and upper lemmas adjacent to the branch axes; lower florets sterile; upper florets sessile or stipitate, bisexual, acute or rounded; lower glumes absent or present only on some spikelets of each branch, without veins or 1-veined, unawned; upper glumes and lower lemmas subequal, membranous, apex rounded, unawned; lower paleas absent or rudimentary; upper lemmas convex, indurate, smooth to slightly rugose, stramineous to dark brown, margins scarious, involute, clasping the paleas; upper paleas indurate, smooth to slightly rugose, stramineous to dark brown. Caryopsis orbicular to elliptical, plano-convex or flattened, white, yellow, or brown. x = 10, 12.

Paspalum includes about 310 species, most of which are native to the Western Hemisphere (Soreng et al., 2017b).

KEY TO SPECIES OF PASPALUM

- 1. Upper florets dark brown.

 2. Plants perennial; sterile lemma with corrugated or rippled margins; panicle branch rachis 0.5–1 mm wide, not winged

 2. Plants annual; sterile lemma without corrugated or rippled margins; panicle branch rachis 1–2 mm wide, winged

 P. convexum
- 1. Upper florets white-yellowish or straw-colored.

 - 3. Racemes numerous, generally more than 2, racemose or fasciculate on the axes and not conjugate or paired; spikelets paired.
 - 4. Spikelets 1.4–2.6 mm long.
 - 4. Spikelets 2.1–3.6 mm long.

299. *Paspalum botterii* (E. Fourn.) Chase, J. Wash. Acad. Sci. 13(20): 436. 1923.

Caespitose perennial. Culms 23–125 cm tall, erect; nodes glabrous or pubescent. Sheaths hirsute with tubercled-based hairs; ligules 0.6–1.9 mm long, an eciliate membrane; blades 17–44 cm long, 12–24 mm wide, flat, pilose, hairy with tubercle-based hairs. Panicles 5–25 cm long, terminal, with 3–7 racemose branches along a central axis, unilateral; racemes 5–20 cm long, erect to divergent, terminating in a spikelet; rachis narrowly winged 0.5–1 mm

wide, glabrous or ciliare on margins. Spikelets 2.2–2.5 mm long, 1.3–1.6 mm wide, paired, obovate, dorsally compressed, obtuse, stramineous to brown, falling entire, densely packed, irregular, 4-rowed; lower glumes 0.4–1.2(1.8) mm long, 1-veined, present in some spikelets (on the subsessile), thinner than fertile lemma; upper glumes 2.0–2.4 mm long, puberulous, 3- to 5-veined, membranous; lemmas 2.1–2.5 mm long, striate, puberulous, 3- to 5-veined, indurate, pallid; paleas involute, indurate. Caryopsis 1.3–1.5 mm long, light to dark brown. 2n = 40, 60.

DISTRIBUTION AND HABITAT. *Paspalum botterii* is native to North America and extends from Mexico to Venezuela. It grows at the edges of moist woods and in disturbed areas.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: 14.5 km N of Batopilas on road to La Bufa, 12 Sep 1989, 850 m, *P.M. Peterson, Annable & Y. Herrera 8065* (US). 300. *Paspalum convexum* Humb. & Bonpl. ex Flüggé, Gram. Monogr., *Paspalum* 175. 1810.

FIGURE 190

Annual. Culms 10-53 cm long, erect; nodes glabrous. Sheaths pubescent or glabrous; ligules 2-4.1 mm long; blades 5-25(80) cm long, 2.9-10.2(12) mm wide, flat. Panicles terminal, with 1-5 racemosely arranged branches; the branches 1.1-5.4(7) cm long, divergent; branch axes 0.8-1.3 mm wide, not or narrowly winged, glabrous, terminating in a spikelet. Spikelets 2.1-2.6 mm long, 1.7-2.4 mm wide, paired, appressed to the branch axes, broadly obovate to suborbicular, shortly pubescent, light to dark brown; lower glumes absent; upper glumes and lower lemmas short-pubescent, 5- to 7-veined, margins entire, not corrugated; lower paleas rarely present; upper florets dark glossy brown. Caryopsis 1.3-1.5 mm long, white. 2n=30, 32, 40, 60.

DISTRIBUTION AND HABITAT. Paspalum convexum grows in disturbed areas in the southeastern United States. It is native in Mexico, Central America, northern South America, and the Caribbean Islands (Zuloaga et al., 2003).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bachiniva: about 4 mi SE of Bachiniva, 20 Oct 1968, pine and oak woodland, 1800 m, Spellenberg & M. Spellenberg 2000 (ENCB, NMC). FIGURE 191

Perennial; hardened near the base; rhizomatous sometimes caespitose. Culms 5-65 cm tall, erect; nodes glabrous. Sheaths glabrous, sparsely long-pubescent distally; ligules 1–2 mm long; blades to 14 cm long, 1.8-11.5 mm wide, flat or conduplicate, glabrous or pubescent, apex involute. Panicles terminal, usually composed of a digitate pair of branches, a third branch sometimes present below; branches 1.4-7 cm long, diverging, often arcuate; branch axes 1.2-2.2 mm wide, winged, glabrous, margins scabrous, terminating in a spikelet. Spikelets 2.4-3.2 mm long, 1.1–1.6 mm wide, solitary (rarely paired), appressed to the branch axes, broadly elliptic, stramineous, sometimes partially purple; lower glumes absent or, if present, up to 1 mm long and triangular; upper glumes sparsely and shortly pubescent on the back, 3-veined; lower lemmas glabrous, 3-veined; upper florets stramineous. Caryopsis 1.9–2.1 mm long, yellow. 2n = 20, 30,40, 48, 60, 61.

DISTRIBUTION AND HABITAT. Paspalum distichum grows on the edges of lakes, ponds, rice fields, and wet roadside ditches. It is native to warm regions throughout the world, being most abundant in humid areas. In the Western Hemisphere it occurs in the United States and ranges south to Argentina and Chile.

302. Paspalum plicatulum Michx., Fl. Bor.-Amer. 1: 45. 1803.

FIGURE 192

Caespitose perennial; rhizomes short, often indistinct. Culms 30-120 cm tall, erect, or geniculately ascending. Ligules 2-3 mm long, an eciliate membrane; blades 15-30 cm long, 2-7 mm wide, flat or folded, surface glabrous or pilose, apex acuminate. Inflorescence composed of 2-7 racemes, the racemes 2-15 cm long, borne along a central axis, unilateral, the central axis 3-15 cm long; rachis 0.5-1 mm wide, wingless, angular. Spikelets 2.3-3.2 mm long, 1.5-2.2 mm wide, in pairs, with 1 basal sterile floret; 1 fertile floret, 2- to 4-rowed; fertile spikelets pedicelled, without rhachilla extension, elliptic or obovate, dorsally compressed, plano-convex, obtuse, falling entire; lower glume absent; upper glume reaching apex of floret, thinner than fertile lemma, ovate, membranous, without keels, 5-veined, surface glabrous or puberulous; lemma of lower sterile floret similar to upper glume, ovate, as long as the spikelet, membranous, corrugated or rippled near margins, 5-veined, obtuse; fertile lemma 2-3 mm long, ovate, gibbous, indurate, dark brown, surface granulose, margins involute; palea involute, indurate. 2n = 10, 20.

DISTRIBUTION AND HABITAT. Paspalum plicatulum grows on the edges of forests and disturbed areas. It is native to the Americas: south central and southeastern United States to Mexico, South America, and the Caribbean Islands. It has been reported from Chihuahua (Herrera Arrieta 2001).

303. Paspalum prostratum var. pygmaeum Scribn. & Merr., Bull. Div. Agrostol., U.S.D.A. 24: 9. 1901.

Caespitose annual. Culms 2–8(15) cm tall, erect to geniculate near base. Sheaths with scattered papillose-based hairs, these often appressed; ligules 0.4–0.6 mm long, a ciliate membrane; blades 1.5–7.5 cm long, 2–7 mm wide, lanceolate, flat, pilose, the hairs papillose-based. Panciles terminal with 1–4 racemes; the racemes 0.7–2 cm long, 2.2–2.5 mm wide, winged, exserted or partially enclosed in the sheath, reflexed and spreading at 80°–100° from the culm axis; rachis nodes hairy. Spikelets 2–2.2 mm long, glabrous, light yellowish, solitary in 2 rows; lower glume absent; upper glumes 2 mm long, elliptic, hyaline, 3-veined; lemmas 2 mm long, elliptic, 3-veined, chartaceous, shiny.

DISTRIBUTION AND HABITAT. Paspalum prostratum var. pygmaeum can be found growing on rocky slopes with Pinus, Juniperus, and Holodiscus in wet clayish soils between

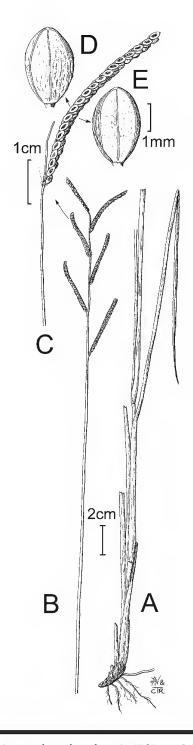

FIGURE 192. Paspalum plicatulum. A. Habit. B. Culm and Inflorescence. C. Inflorescence branch. D. Spikelet showing upper glume. E. Spikelet showing lower lemma. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

1,700 and 3,300 m. It is known from the states of Durango, Jalisco, México, Distrito Federal, Michoacán, Morelos, and Veracruz (Herrera Arrieta, 2001; Dávila et al., 2006). *Paspalum prostratum* var. *pygmaeum* can be separated from *Paspalum prostratrum* Scribn. & Merr. var *prostratum* in having undifferentiated leaf blade bases (rounded in the latter variety), narrower leaf blades (2–7 versus 8–20 mm wide), and shorter culms (2–8[15] versus 30–75 cm tall) (Clayton et al., 2006).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guadalupe y Calvo: near Cumbres Mohinora, 13 Sep 2006, 3250–3300 m, *P.M. Peterson 20035*, *F. Sánchez Alvarado*, *E.P. Gómez Ruíz* (CIIDIR, US).

304. Paspalum pubiflorum Rupr. ex E. Fourn., Mexic. Pl. 2: 11. 1886.

FIGURE 193

Perennial; usually decumbent, rooting at the nodes, stoloniferous. Culms 30-130 cm long, decumbent; nodes glabrous or pubescent. Sheaths glabrous or pubescent; ligules 1-3.2 mm long; blades to 31 cm long, 4-18 mm wide, flat, glabrous, with a few hairs behind the ligules. Panicles terminal, with 2-7 racemosely arranged branches; branches 2.2-7.9 cm long, divergent to spreading, terminating in a spikelet; branch axes 1.1-2.3 mm wide, narrowly winged, glabrous, margins scabrous. Spikelets 2.8-3.6 mm long, 1.5-2 mm wide, paired, imbricate, appressed to divergent from the branch axes, elliptic to obovate, pubescent or glabrous, light brown to stramineous; lower glumes absent; upper glumes and lower lemmas 2.8-3.6 mm long, glabrous or sparsely pubescent, the hairs shorter than 0.1 mm long, 3-veined, margins entire; lower lemmas lacking ribs over the veins; upper florets stramineous. Caryopsis 1.8-2 mm long, golden brown or white. 2n = 60, ca. 64.

DISTRIBUTION AND HABITAT. *Paspalum pubiflo-rum* grows on the edges of forests and in disturbed areas. It is native to the southeastern United States, Mexico, and Cuba.

305. Paspalum setaceum Michx., Fl. Bor.-Amer. 1: 43. 1803.

FIGURE 194

Perennial; caespitose or short rhizomatous. Culms 40–110 cm tall, erect, spreading, or prostrate; nodes glabrous or pubescent. Sheaths glabrous or pubescent; ligules 0.2–0.5 mm long; blades flat, glabrous or pubescent. Panicles terminal and axillary, with 1–6 racemosely arranged branches, axillary panicles partially or completely enclosed by the subtending leaf sheath; branches 2–12(17) cm long, ascending to spreading, often arcuate, terminating in a spikelet; branch axes 0.2–1.2 mm wide, glabrous, sometimes scabrous. Spikelets 1.4–2.6 mm long, paired, imbricate, appressed to the branch axes, elliptic to obovate to ovate to orbicular, stramineous or brown; lower glumes absent; upper glumes and lower lemmas glabrous or with short capitate-pubescent (glandular tipped), 3-veined, margins entire; lower lemmas lacking ribs over the veins; upper florets stramineous. Caryopsis elliptic to suborbicular, white, 2n = 20.

DISTRIBUTION AND HABITAT. Paspalum setaceum is a variable species that grows east of the Rocky Mountains in the contiguous United States and Mexico. Paspalum setaceum has nine varieties in North America; P. setaceum var. ciliatifolium and P. setaceum var. setaceum are known from Mexico, and both occur in Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua, 10–20 Oct 1935, LeSueur Mex-062 (US); 1 km al E del Rancho El 45, 28 Sep 73, 1450 m, J. Valdés-Reyna VR-369 (RELC). Juárez: near Paso del Norte, 23 Sep 1886, C.G. Pringle 1123 (US).

KEY TO VARIETIES OF PASPALUM SETACEUM

Peyritschia E. Fourn.

Perennial; caespitose. Culms erect or decumbent, slender or weak. Ligules an eciliate membrane; blades flat or involute. Inflorescence a panicle, open or contracted, sometimes spiciform. Spikelets solitary, comprising 2 fertile florets, without rachilla extension or with a barren rachilla extension, sometimes with reduced florets at the apex; spikelets oblong or cuneate, disarticulating below each floret. Glumes linear, lanceolate or elliptic, persistent, hyaline or membranous, shorter than spikelets, same size or exceeding the apex of the floret, lower glumes 1-veined,

upper glumes 1- to 3-veined, as long as fertile lemma; fertile lemmas lanceolate, elliptic or oblong, subterete, membranous or cartilaginous, 5-veined, lemma surface snooth or scaberulous, the margins flat or involute, the apex entire, toothed or 2- to 4-lobed, 1-awned, dorsally emerging, straight or geniculate; palea embraced by lemma or gaping, same size or a little less than the lemma, hyaline or membranous; apical sterile florets resembling fertile but underdeveloped. Caryopsis with adherent pericarp, fusiform, soft; endosperm liquid. x = 7.

Peyritschia is a genus with seven species native to temperate regions of the New World (Finot et al., 2004, 2006).

KEY TO SPECIES OF PEYRITSCHIA

306. Peyritschia deyeuxioides (Kunth) Finot, Contr. U.S. Natl. Herb. 48: 478. 2003. Avena deyeuxioides Kunth, Nov. Gen. Sp. (quarto ed.) 1: 147. 1816. Trisetum deyeuxioides (Kunth) Kunth, Révis. Gramin. 1: 102. 1829.

Caespitose perennial. Culms 50-120 cm tall, slender, erect or ascending, glabrous, simple, sometimes branched on the lower nodes. Sheaths glabrous, scabrous or pilose; ligules (0.5)1-4 mm long; blades 8-25 cm long, (1.5)2-6 mm wide, flat, glabrous or pilose. Panicles 10-35 cm long, 1-4 cm wide, narrow, lax, somewhat open and nodding, axis visible at least partially, scabrous, often pilose; branches 6-11 cm long, appressed or ascending, fasciculate, the longest naked on the lower 1/3-1/2. Spikelets 4.5-6(8) mm long, 2- or 3-flowered, disarticulation above glumes and between florets; rachilla hairy, the hairs 1.5-2.5 mm long near the summit of each internode; internodes 1-1.7 mm long; glumes 3.5-5.5(8) mm long, subequal, 1-veined, scabrous on the back; lemma of fertile florets 3.5-4.5(6) mm long, subcylindrical, glabrous, the margins involute, apex 2-lobed, the lobes rounded, truncate or acute, awned, the awns 5–9(12) mm long, emerging 2–3 mm above the base of the lemma, geniculate and flexuous or twisted below, scabrous and pilose, the hairs 2.5–3 mm long; stamens 2, the anthers 1-1.5(2.5) mm long. Caryopsis 1.8-2.5 mm long. 2n = 14, 28.

DISTRIBUTION AND HABITAT. Peyritschia deyeuxioides grows in moist meadows and grasslands, thorny scrub, and oak-pine forests. It is native in Mexico, Central America, and South America.

Specimens EXAMINED. MEXICO. Chihuahua. Balleza: Camino Balleza-Guachochic, km 45, 24 Sep 1981, pastizal [pastureland], R. 307. Peyritschia pringlei (Scribn.) S. D. Koch, Taxon 28(13): 233. 1979. Deschampsia pringlei Scribn., Proc. Acad. Nat. Sci. Philadelphia 43(2): 300–301, t. 13, f. 1, 1a. 1891.

Caespitose perennial. Culms 30–100 cm tall, glabrous, simple. Sheaths glabrous, sometimes pubescent below; ligules 1.5–4 mm long, membranous, truncate or rounded; blades 5–15 cm long, 1–3(4) mm wide, flat, occasionaly involute, glabrous to pilose. Panicles 7–15(20) cm long, 0.5–1.5 cm wide, compact, narrow to somewhat open and interrupted below, axis hidden between the spikelets, scabrous; rachilla hairy, the hairs inconspicuous; branches ascending and appressed. Spikelets (3.5)4–5 mm long, 2- or 3-flowered, disarticulation above glumes and between florets; rachilla sparsely pilose, the hairs 0.7–1 mm long; glumes 4.1–5.3 mm long, equal to subequal, 1-veined; lemma of lower floret 3–4.3 mm long, the upper shorter, apex 2-lobed, the lobes rounded, awns (4.5)5–7 mm

long, emerging 1 mm above the base of the lemma, geniculate and twisted near the base; stamens 2, anthers 0.8-1 mm long. Caryopsis 1.5-2 mm long. 2n = 28.

DISTRIBUTION AND HABITAT. Peyritschia pringlei grows in grasslands and oak-pine forests. It is native in Mexico, Central America, and South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: 1.1 km N of San Juanito near large lumber mill, 24 Sep 1988, 2200 m, P.M. Peterson & Annable 5865 (ENCB, US). Chihuahua: Chihuahua, 9 Oct 1887, C.G. Phalaris L.

Annual or perennial; caespitose or not, sometimes rhizomatous. Culms sometimes swollen at the base, not branching above

the base. Leaves more or less evenly distributed, glabrous; sheaths open for most of their length, uppermost sheaths often somewhat inflated; auricles absent; ligules hyaline, truncate to acuminate, entire or lacerate, glabrous; blades usually flat, sometimes revolute. Inflorescence a terminal panicle, sometimes spikelike, ovoid to cylindrical, dense, sometimes interrupted, with 10-200 spikelets borne singly or in clusters, the spikelets homogamous in species with single spikelets, heterogamous in species with the spikelets in clusters, the lower spikelets in the clusters staminate (rarely sterile), the terminal spikelets bisexual or pistillate. Spikelets pedicellate, homomorphic, laterally compressed, 1- to 3(4)-flowered, only the terminal (or only) floret reproductively functional, the lower floret(s), if present, sterile; disarticulation in species with single spikelets above the glumes, the florets falling together or, in species with clustered spikelets, usually at the base of the spikelet clusters, sometimes beneath the bisexual or pistillate spikelets; glumes equal or almost so, exceeding the florets, 1- to 5-veined, keeled, keels often conspicuously winged; lower (sterile) florets reduced, varying from knoblike projections on the calluses of the terminal florets to linear or lanceolate lemmas less than 34 as long as the terminal florets; terminal florets usually bisexual, pistillate, or staminate, rarely sterile, in the lower spikelets of a spikelet cluster; lemmas of terminal florets coriaceous to indurate, shiny, glabrous or pubescent, inconspicuously 5-veined, acute to acuminate or beaked, unawned; paleas similar to the lemmas in length and texture, enclosed by the lemmas at maturity, 1-veined, mostly glabrous, veins shortly hairy; lodicules absent or 2 and reduced; anthers 3; ovaries glabrous; styles 2, plumose. Caryopsis with a reticulate pericarp, falling free of the lemma and palea; hila long-linear. x = 6, 7.

Phalaris has 17 species, most of which grow in temperate regions (Baldini, 1995; Clayton et al., 2006). It is found in a wide range of habitats, although most species prefer somewhat mesic, disturbed sites.

KEY TO SPECIES OF PHALARIS

- - 2. Glume keels not winged or with wings no more than 0.2 mm wide.
 - 2. Glume keels broadly winged, the wings 0.2–1 mm wide.

 - 4. Sterile florets 2, equal to subequal, 0.5–4.5 mm long.

 - 5. Panicles usually ovoid to ellipsoid, occasionally cylindrical, continuous, not lobed.

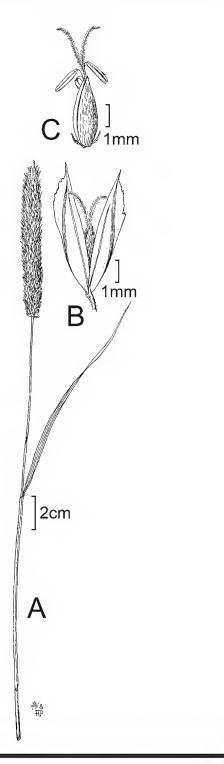

FIGURE 195. *Phalaris angusta*. A. Culm and inflorescence. B. Spikelet. C. Florets. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

308. Phalaris angusta Nees ex Trin., Sp. Gram. 1: t. 78. 1827.

FIGURE 195

Annual; not rhizomatous. Culms 10–170 cm tall. Ligules 4–7 mm long, truncate to rounded or obtuse, lacerate; blades 3–1.5 cm long, 2–1.2 mm wide. Panicles 2–1.5 cm long, 0.6–1.5 cm wide, cylindrical, discontinuous, sometimes lobed; branches sometimes evident, the spikelets borne singly, not clustered. Spikelets homogamous, all spikelets with a bisexual floret; florets 3; disarticulation above the glumes, beneath the sterile florets; glumes 2–1.5 mm long, 0.6–1.1 mm wide, rectangular, often purplish, keels winged, scabrous, wings about 0.4 mm wide, smooth, lateral veins conspicuous, scabrous, apex mucronate; sterile florets 2, 0.5–1.5 mm long, equal, linear, sparsely and inconspicuously hairy; bisexual florets 2–3.8 mm long, 0.9–1.5 mm wide, laterally compressed, pubescent, particularly distally, shiny, apex tapering; anthers 0.5–1.3 mm long, 1.5 mm wide, laterally compressed, pubescent, particularly distally, shiny, apex tapering; anthers 0.5–1.3 mm long, 1.5 mm lon

DISTRIBUTION AND HABITAT. *Phalaris angusta* grows in the contiguous United States and Mexico and in South America from Ecuador south to Chile and Argentina. This species occurs in open grasslands and prairies. Reported from Chihuahua by Espejo Serna et al. (2000).

309. Phalaris aquatica* L., Cent. Pl. I. 4. 1755.

FIGURE 196

Caespitose perennial; short rhizomatous. Culms 60-200 cm tall, often swollen at the base, rooting at the lower nodes. Ligules 2–12 mm long, truncate, lacerate; blades 5–15(20) cm long, 0.5-10 mm wide. Panicles 1.5-15 cm long, 1-2.5 cm wide, usually cylindric, sometimes ovoid, occasionally lobed at the base, the spikelets borne individually, not clustered; branches not evident. Spikelets homogamous, all spikelets with a bisexual floret; florets 2-3(4), occasionally with 2 bisexual florets, occasionally the terminal floret viviparous; disarticulation above the glumes, beneath the sterile florets; glumes 4.4– 7.5 mm long, 1.2-1.5 mm wide, keels winged distally, wings 0.2-0.4 mm wide, usually entire, lateral veins conspicuous, smooth; sterile florets usually 1, if 2, the lowest floret much shorter, to 0.7 mm long, the upper or only sterile floret 1–3 mm long, pubescent; bisexual florets 3.1-4.6 mm long, 1.2-1.5 mm wide, pubescent, stramineous, acute; anthers 3-3.6 mm long. 2n = 28.

DISTRIBUTION AND HABITAT. Phalaris aquatica is native to the Mediterranean region and was introduced into South America because of its forage value. It is also reported as introduced to Chihuahua, Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: Rancho La Campana, 4 km al E de la carr. Panamericana, 17 May 1975, jardín de adaptación de zacates [grass adaptation garden], 1500 m, *J. Valdés-Reyna VR-903* (RELC).

310. Phalaris arundinacea L., Sp. Pl. 1: 55. 1753.

FIGURE 197

Perennial; not caespitose, rhizomatous, rhizomes scaly. Culms 40-250 cm tall. Ligules 4-10(11) mm long, truncate, lacerate; blades 10-30 cm long, 5-20 mm wide, surfaces scabrous, margins serrate. Panicles 5-40 cm long, 1-2 cm wide, elongate, often dense, always evidently branched at least near the base; branches to 9 cm long, normally appressed but spreading during anthesis, the spikelets borne singly, not clustered. Spikelets homogamous, all spikelets with a bisexual floret; florets 3; disarticulation above the glumes and beneath the sterile florets; glumes 4-8.1 mm long, 0.8-1 mm wide, subequal, keels smoothly curved, usually scabrous, not or narrowly winged distally, wings to 0.2 mm wide, lateral veins inconspicuous, apex acute; sterile florets 2, 1.5–2 mm long, less than ½ as long as the bisexual spikelets, subequal to equal, pubescent; bisexual florets 2.5-4.2 mm long; lemmas glabrous below, pubescent distally and on the margins, dull yellow when immature, shiny gray-brown

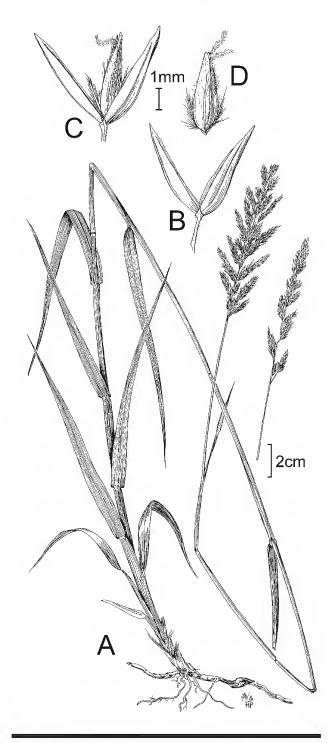

FIGURE 197. *Phalaris arundinacea*. A. Habit. B. Glumes. C. Spikelet. D. Florets. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

to brown at maturity, apex acute; anthers 2.5-3 mm long. 2n = 27, 28, 29, 30, 31, 35.

DISTRIBUTION AND HABITAT. *Phalaris arundinacea* is a circumboreal species, native to north temperate regions; it is introduced in the Southern Hemisphere. It grows in wet areas such as the edges of lakes, ponds, ditches, and creeks, often forming dense stands; in some areas it is a problematic weed.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Práxedis G. Guerrero: Rancho Escuela, km 65, 16 Aug 1997, cultivo de alfalfa, *I. Enriquez*, *S. Ordoñez*, *L. Sushii*, *S. Carrasco*, *A. Perales & N. Loya IEA14* (UAC]).

311. Phalaris canariensis* L., Sp. Pl. 1: 54-55. 1753.

FIGURE 198

Annual. Culms 30–100 cm tall. Ligules 3–6 mm long, rounded to obtuse, lacerate; blades 3–25 cm long, 2–10 mm wide. Panicles 1.5–5 cm long, 1.5–2 cm wide, ovoid to oblong-ovoid, continuous, not lobed, truncate at the base; branches not evident, the spikelets borne singly, not clustered. Spikelets homogamous, all spikelets with a bisexual floret; florets 3; disarticulation above the glumes, beneath the sterile florets; glumes 7–10 mm long, 2–2.5 mm wide, smooth, mostly glabrous, sometimes sparsely pilose between the veins, keels winged, the wings to 0.6 mm long, widening distally, lateral veins inconspicuous, smooth, apex rounded, mucronate; sterile florets 2, 2–4.5 mm long, $\frac{1}{3}$ or more the length of the bisexual florets, equal or subequal, lanceolate, sparsely pubescent, acute; bisexual florets 4.5–6.8 mm long, ovate, densely pubescent, shiny, stramineous to gray-brown; anthers 2–4 mm long, 2n = 12.

DISTRIBUTION AND HABITAT. Phalaris canariensis is native to southern Europe and the Canary Islands but is now widespread and is mostly grown for birdseed. This species has been reported from Chihuahua (Espejo Serna et al., 2000; Dávila et al., 2006).

312. Phalaris caroliniana Walter, Fl. Carol. 74. 1788.

FIGURE 199

Annual; not rhizomatous. Culms to 150 cm tall. Ligules 1.5–7 mm long, truncate to broadly acute; blades 1.5–15 cm long, 2–11 mm wide, smooth, shiny green, apex acuminate. Panicles 0.5–8(8.5) cm long, 0.8–2 cm wide, ovoid to subcylindrical; branches not evident, the spikelets borne singly, not clustered. Spikelets homogamous, all spikelets with a bisexual floret; florets 3; disarticulation above the glumes, below the sterile florets; glumes 3.8–6(8) mm long, 0.8–1.5 mm wide, keels smooth or scaberulous, narrowly to broadly winged distally, the wings 0.1–0.5 mm wide, entire, smooth, lateral veins prominent, usually smooth, sometimes scaberulous, apex acute or acuminate; sterile florets 2, 1.5–2.5 mm long, ½ or more the length of the bisexual florets, pubescent; bisexual florets 2.9–4.7 mm long, 0.9–1.8 mm wide, pubescent, shiny, stramineous when immature, brown when mature, apex acuminate to beaked; anthers 1.5–2 mm long, 2*n* = 14.

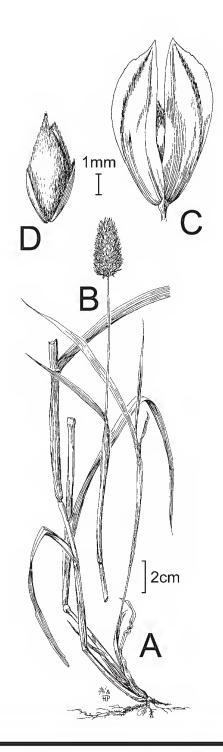

FIGURE 198. *Phalaris canariensis*. A. Habit. B. Culm and inflorescence. C. Spikelet. D. Florets. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

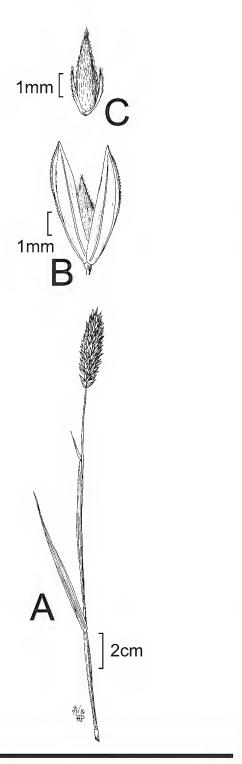

FIGURE 199. *Phalaris caroliniana*. A. Habit. B. Spikelet. C. Florets. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

DISTRIBUTION AND HABITAT. *Phalaris caroliniana* grows in wet, marshy, and swampy ground. It is a common species in much of southern United States and northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ascensión: alrededores del cruce [around the crossing] del río Casas Grandes con la carr. [hwy] Juárez–Ascensión, 11 Jun 2005, 1180 m, R. Corral, M. Vargas & H. Corral, Bye, A. Domínguez, K. Chico & A. Soutyrine RCD6083 (UACJ).

313. Phalaris paradoxa* L., Sp. Pl. (ed. 2) 2: 1665. 1763.

FIGURE 200

Caespitose annual. Culms 20–100 cm tall, not swollen at the base. Ligules 3-5 mm long, truncate to acute; blades 5-10(15) cm long, 2-5 mm wide. Panicles 3-9 cm long, about 2 cm wide, dense, obovoid to clavate, tapering at the base, rounded to truncate at the top; branches with groups of 5-6 usually staminate, rarely sterile spikelets clustered around a terminal pistillate or bisexual spikelet, the spikelets homomorphic; pedicels hispid; disarticulation beneath the spikelet cluster. Spikelets heterogamous, some staminate or sterile, others bisexual or pistillate; florets 3, the lower 2 florets sterile, highly reduced, the terminal floret staminate, pistillate, or bisexual (rarely sterile); glumes of staminate or sterile spikelets to 9 mm long, usually narrowly winged and clavate, those of the spikelets at the base of the panicles reduced to knobs of tissue terminating the pedicels; glumes of pistillate or bisexual spikelets 5-8 mm long, about 1 mm wide, keeled, keels winged, the wings 0.2-0.4 mm wide, terminating below the apex and forming a single, prominent tooth, lateral veins conspicuous, apex acuminate to awned, awns about 0.5 mm; sterile florets of all spikelets 0.2-0.4 mm long, knoblike projections on the calluses of the terminal florets, often with 1-2 hairs; terminal florets of all spikelets 2.5-3.5 mm long, 0.8-1.5 mm wide, indurate, shiny, glabrous or with a few short hairs near the tip; anthers 1.5-2.5 mm long. 2n = 14.

DISTRIBUTION AND HABITAT. *Phalaris paradoxa* is native to the Mediterranean region; it is now found throughout the world, primarily in waste areas and near old dumps. This species has been reported in Chihuahua (Espejo Serna et al., 2000; Dávila et al., 2006).

Phragmites Adans.

Perennial; rhizomatous or stoloniferous, often forming dense stands. Culms leafy; internodes hollow. Leaves cauline, mostly glabrous; sheaths open; ligules membranous, ciliate; blades flat

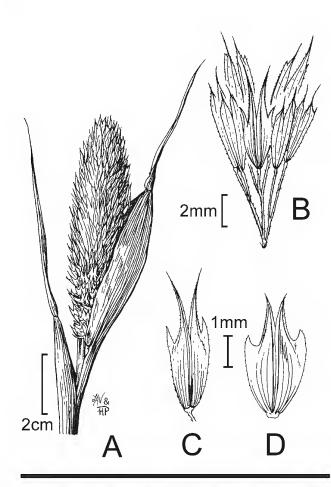

FIGURE 200. *Phalaris paradoxa*. A. Inflorescence. B. Inflorescence branch. C. Sterile spikelet. D. Fertile Spikelet. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

or folded. Inflorescence terminal, a plumose panicle. Spikelets with 2–8 florets, weakly laterally compressed, lower 1–2 florets staminate, distal 1–2 florets rudimentary, remaining florets bisexual; rachilla internodes sericeous; disarticulation above the glumes and below the florets; glumes unequal, shorter than the florets, 1- to 3-veined, glabrous; lower glumes much shorter than the upper glumes; calluses pilose; lemmas 3-veined, glabrous, unawned; anthers 1–3. Caryopsis rarely maturing. x = 12.

The genus is treated as having four species worldwide. *Phragmites australis* has been divided into three subspecies in North America and a key is included below even though no specimens have been seen by us (Saltonstall et al., 2004; Saltonstall and Hauber, 2007).

314. Phragmites australis (Cav.) Steud., Nomencl. Bot. (ed. 2) 1: 143. 1840. Arundo australis Cav., Anales Hist. Nat. 1(2): 100–101. 1799.

FIGURE 201

Culms 1–4 m tall, 0.5–1.5 cm thick, erect. Ligules 0.4–1.7 mm long; blades 15–40 cm long, 2–4 cm wide, long-acuminate, disarticulating from the sheath at maturity. Panicles 15–35 cm long, 8–20 cm wide, ovoid to lanceoloid, often purplish when young, straw-colored at maturity. Spikelets with 3–10 florets; rachilla hairs (4)6–10 mm long; lower glumes 2.5–6.5 mm long; upper glumes 4.5–11 mm long; lemmas 7.5–13.5 mm long, glabrous, linear, margins somewhat inrolled, apex long-acuminate; paleas 3–4 mm long, membranous; anthers 1.5–2 mm long, purplish; styles persistent. Caryopsis 2–3 mm long, rarely maturing. 2n = 36, 42, 44, 46, 48, 49-54, 72, 84, 96, 120.

DISTRIBUTION AND HABITAT. *Phragmites australis* grows in wet or muddy ground along waterways, in saline or freshwater marshes, and in sloughs throughout North America. Its tall, leafy, often persistent culms and plumose panicles make it one of our easier species to recognize. This species is reported from Chihuahua in Espejo Serna et al. (2000), Dávila et al. (2006), and Herrera Arrieta and Cortés Ortiz (2010).

KEY TO SUBSPECIES OF PHRAGMITES AUSTRALIS

- 1. Ligules 1.0–1.7 mm long; lower glumes 3.0–6.5 mm long; upper glumes 5.5–11.0 mm long; lemmas 8.0–13.5 mm long; leaf sheaths caducous with age; culms exposed in the winter, smooth and shiny; rarely occurs in a monoculture *P. australis* subsp. *americanus* Saltonstall, P. M. Peterson & Soreng (native lineage)
- 1. Ligules 0.4–0.9 mm long; lower glumes 2.5–5.0 mm long; upper glumes 4.5–7.5 mm long; lemmas 7.5–12.0 mm long; leaf sheaths not caducous with age; culms not exposed in the winter, smooth and shiny or ridged and not shiny; usually occurs as a monoculture.

Piptochaetium J. Presl

Perennial; caespitose, not rhizomatous. Culms usually erect, sometimes decumbent, glabrous, not branched above the base; basal branching intravaginal; prophylls shorter than the

sheaths, mostly glabrous, keels usually with hairs, apex bifid, teeth; cleistogenes not developed. Sheaths open to the base, margins glabrous; ligules membranous, decurrent, truncate to acute, sometimes highest at the sides, sometimes ciliate; blades convolute to flat, translucent between the veins, often sinuous distally.

Inflorescence a terminal panicle, open or contracted, spikelets usually confined to the distal ½ of each branch. Spikelets with 1 floret; rachillas not prolonged beyond the base of the floret; disarticulation above the glumes, beneath the floret; glumes subequal, longer than the floret, lanceolate, 3- to 7(8)-veined; florets globose to fusiform, terete to laterally compressed; calluses well-developed, sharp or blunt, glabrous or antrorsely strigose, hairs yellow to golden brown; lemmas coriaceous to indurate, glabrous or pubescent, striate, particularly near the base, smooth, papillose, or tuberculate, often smooth on the lower portion and papillate to tuberculate distally, margins involute, fitting into the grooved palea, apex fused into a crown, awned,

lemmas often narrowed below the crown, crowns usually ciliate; **awns** caducous to persistent, usually twice-geniculate, first 2 segments usually twisted and hispid, terminal segment straight and scaberulous; **paleas** longer than the lemmas, similar in texture, glabrous, sulcate between the veins, apex prow-tipped; **lodicules** 2 or 3, membranous, glabrous, blunt or acute; **anthers** 3; **ovaries** glabrous; **styles** 2. **Caryopsis** terete to globose or lensshaped. x = 11.

Piptochaetium is primarily South American, being particularly abundant in Argentina (Ciadella et al., 2007). There are eight species of *Piptochaetium* in Mexico, three of which are known to occur in Chihuahua (Espejo Serna et al., 2000).

KEY TO SPECIES OF PIPTOCHAETIUM

- 315. *Piptochaetium fimbriatum* (Kunth) Hitchc., J. Wash. Acad. Sci. 23(10): 453. 1933. *Stipa fimbriata* Kunth, Nov. Gen. Sp. (quarto ed.) 1: 126. 1815.

FIGURE 202

Culms 35-95 cm tall, usually glabrous, sometimes pubescent below the nodes; nodes 2-3, often dark, glabrous. Sheaths glabrous, smooth; ligules of basal leaves 0.4-1.8 mm long, of upper leaves 1.5-2 mm long, truncate to rounded; blades 6-26 cm long, 0.3-0.5 mm in diameter, usually involute, sometimes flat and 0.5-1(1.5) mm wide, 3-veined, glabrous, veins often scaberulous, margins scabrous. Panicles 6.5-25 cm long, open, often partially enclosed in the upper leaf sheath, with 20-60 spikelets; branches flexuous; pedicels 4-12 mm long, flattened, hispid; glumes 4-6.2 mm long, 1.8-3.1 mm wide, subequal, 5to 7-veined, often partly purplish; florets 2.3-5 mm long, 0.6-1.9 mm thick, somewhat laterally compressed, obovate in side view, asymmetrical; callus 0.2-0.7 mm long, blunt, strigose; lemmas awned, tan to light chocolate brown, shiny, smooth, evenly pubescent when immature, hairs easily rubbed off; crowns about 0.8 mm wide, inconspicuous, glabrous or glabrate; awns 11-20 mm long, persistent, twice-geniculate; paleas about 3.5 mm long; lodicules about 1 mm long, 2; anthers 0.3-0.5 mm long, not penicillate. Caryopsis 2.5-3 mm long, 0.6 mm thick, fusiform. 2n = 42.

DISTRIBUTION AND HABITAT. *Piptochaetium* fimbriatum is an attractive species that grows in oak and pinyon woods in the southwestern United States and adjacent Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 56.4 km W of Parral on road to Balleza and 35.5 km S of Balleza on Mex 432, near Corral de Duarte, 18 Sep 1991, bosque de pino-encino [pine-oak forest], 2210 m, *P.M. Peterson, Annable & Valdés-Reyna* 10713 (CIIDIR, US). Bocoyna:

24.7 mi N of San Juanito on road towards Cuauhtemoc, 5 Sep 2008, 2233 m, P.M. Peterson & J.M. 316. *Piptochaetium pringlei* (Beal) Parodi, Revista Mus. La Plata, Secc. Bot. 6(25): 230, f. 1D. 1944. *Oryzopsis pringlei* Beal, Bot. Gaz. 15(5): 112. 1890.

FIGURE 203

Culms 50–125 cm long, mostly glabrous, pubescent below the nodes; nodes 2–3, dark, glabrous or slightly pubescent. Sheaths smooth to scaberulous; ligules of basal leaves 0.5–2.8 mm long, truncate to rounded; of upper leaves 1–3.5 mm long, rounded to acute; leaf blades 10–30 cm long, 1–3.5 mm wide, flat to loosely folded, prominently 3- to 5-veined, abaxially glabrous, smooth, adaxially smooth or scabrous over the veins, margins smooth or scabrous. Panicles 6–20 cm long, open, with 10–25 spikelets, branches ascending, spreading, flexuous; pedicels to 1 mm long, flattened, hispid; glumes subequal, 9–12 mm long, 2.5–3.5 mm wide; lower glumes 5- to 7-veined; upper

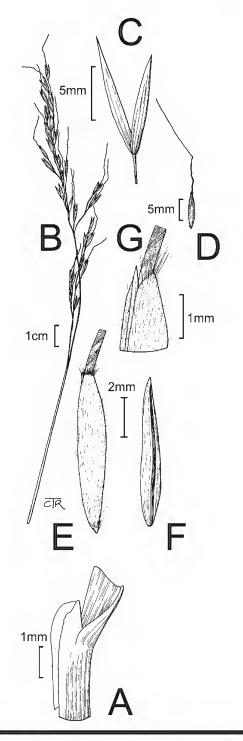

FIGURE 203. Piptochaetium pringlei. A. Ligule. B. Inflorescence. C. Glumes. D. Floret. E. Floret, magnified. F. Palea. G. Apex of lemma. Drawn by Cindy Roché; copyright Utah State University.

glumes 7-veined; florets 6.5–10 mm long, 1.5–2.1 mm thick, symmetrically oblong, terete to somewhat laterally compressed; calluses 0.6–1.9 mm long, blunt to acute, strigose; lemmas 6.5–10 mm long, golden brown to dark brown at maturity, shiny or not, smooth to spiny-tuberculate distally or for almost their entire length, densely pubescent, hairs tawny to golden brown, evenly distributed or somewhat more abundant on the basal ½, apex tapering to the crown; crowns 0.5–0.6 mm long, inconspicuous, straight, hairy, the hairs 0.5–1 mm long; awns 19–27(35) mm long, persistent, twice-geniculate, sometimes inconspicuous; paleas 6.3–9.5 mm long; lodicules 2, 1–1.5 mm long, acute; anthers 3.5–5.5 mm long, sometimes penicillate. Caryopsis about 7 mm long, fusiform. 2*n* = 42.

DISTRIBUTION AND HABITAT. *Piptochaetium pringlei* grows in oak woodlands, often on rocky soils, in the southwestern United States and northwestern Mexico. It is often confused with *P. fimbriatum but* differs from that species in having longer florets and sharper calluses.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: Sánchez, 12 Oct 1910, Hitchcock 7681 (US); 7677 (US); Cabecera de la cañada de Recogoata, 22 Sep 1997, bosque de pino-encino [pine-oak forest], 2400 m, B. 317. *Piptochaetium virescens* (Kunth) Parodi, Revista Mus. La Plata, Secc. Bot. 6(25): 230. 1944.

Caespitose perennial; densely clumped. Culms 100–120 cm tall, wiry. Leaf blades 15–30 cm long, 1 mm wide, involute, filiform. Panicles 10–25 cm long, narrow, lanceolate; primary branches 5–10 cm long, appressed. Spikelets 6–8.5 mm long, oblong, laterally compressed, breaking up at maturity, disarticulating below each floret; florets 5–6.5 mm long; callus 1 mm long, evident, pubescent, acute; glumes 6–8.5 mm long, exceeding apex of florets, elliptic, 3-veined, membranous, equal, purple, persistent, thinner than fertile lemma, apices acute; fertile lemmas 5–6.5 mm long, symmetrically oblong, subterete, indurate, awned, surface papillose, pubescent, margins involute, interlocking with palea keels, the hairs tawny, apex truncate; crown a

ring of hairs of 0.5 mm long; lemma awn 15–20 mm long overall, twice-geniculate with twisted column; palea as long as the lemma, 2-veined, keels contiguous above a sulcus.

DISTRIBUTION AND HABITAT. *Piptochaetium virescens* grows in Mexico, Central America, and South America; the species is uncommon in Chihuahua.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: Cuesta Prieta, 10 km después de la estación [after station] San Juanito, rumbo [course] a Creel, 11 Aug 1997, bosque de pino-encino [pine-oak forest], 2520 m, A. Espejo 5771, A.R. López Ferrari, J. Ceja, A. Mendoza & B. Pérez (CIIDIR, UAMIZ).

Poa L.

Annual or perennial; usually synoecious, sometimes monoecious, gynodioecious, dioecious, and/or asexual; with or without rhizomes or stolons, densely to loosely tufted or the culms solitary. Basal branching intravaginal, pseudointravaginal, or extravaginal; prophylls of intravaginal shoots 2-keeled and open, of pseudointravaginal shoots not keeled and tubular, of extravaginal shoots scalelike. Culms hollow, usually unbranched above the base. Sheaths from almost completely open to almost completely closed, terete or weakly to strongly compressed; auricles absent; ligules membranous, truncate to acuminate; blades flat, folded, or involute, adaxial surfaces with a groove on each side of the midvein, other intercostal depressions shallow, indistinct, apex often prow-shaped. Inflorescences usually terminal panicles, rarely reduced and raceme-like. Spikelets usually laterally compressed, infrequently terete to subterete, usually lanceolate, sometimes ovate; florets (1)2-6(13), usually sexual, sometimes bulb-forming; rachillas usually terete, sometimes prolonged beyond the base of the distal floret; disarticulation above the glumes and beneath the florets; glumes usually shorter than the lowest lemma in the spikelet, usually keeled, 1- to 3(5)-veined, unawned; calluses blunt, usually terete or slightly laterally compressed, sometimes slightly dorsally compressed, glabrous or hairy, hairs often concentrated in 1(3) tufts or webs, sometimes distributed around the calluses below the lemmas as a *crown of hairs*; lemmas usually keeled, infrequently weakly keeled or rounded, similar in texture to the glumes, 5(7-11)-veined, lateral veins sometimes faint, margins scarioushyaline distally, apex scarious-hyaline, truncate or obtuse to acuminate, unawned; paleas from 3/3 as long as to subequal to the lemmas, distinctly 2-keeled, margins and intercostal regions milky white to slightly greenish; lodicules 2, broadly lanceolate, glabrous, lobed; functional anthers (1-2)3; ovaries glabrous. Caryopsis ellipsoidal, often shallowly ventrally grooved, solid. x = 7.

Poa includes about 550 species worldwide and is found principally in temperate and boreal regions (Soreng et al., 2017b). There are 23 species of *Poa* in Mexico, and 6 are known from Chihuahua (Soreng and Peterson 2012).

KEY TO SPECIES OF POA

1. Annual; palea keels distinctly pubescent in part, rarely glabrous but then smooth. 1. Perennial; palea keels glabrous, or sometimes pubescent, but always scabrous in part. 3. Plants with well-developed rhizomes; loosely tufted. 4. Panicles contracted, fairly dense, or slightly open; uppermost culm leaf blades highly reduced or absent; populations 4. Panicles loosely contracted to open; uppermost culm leaf blades usually well-developed; plants all perfect-flowered, or if pistillate or staminate, then panicles open; callus, at least of proximal lemmas, with cobwebby hairs, or glabrous. 5. Leaf blades mostly involute, mostly 1-2 mm wide (expanded), both surfaces moderately to densely scabrous; callus glabrous (rarely with a few short hairs); lemma keel and marginal veins glabrous or puberulent (hairs to 0.25 mm), sometimes puberulent between the veins near the base; plants from uplands of the Chihuahuan Desert P. strictiramea 5. Leaf blades flat or folded, some or most more than 2 mm wide, or if involute in part, then surfaces smooth or nearly so; callus with a dorsal tuft of wooly hairs; lemma glabrous or variously pubescent; plants widespread. 6. Rachilla internodes usually exposed in side view; spikelets 4.5-8 mm long; lemmas glabrous or variously pubescent; ligules truncate to obtuse to acute, sometimes irregularly dentate to lacerate, 0.8-6 mm long; 6. Rachilla internodes mostly hidden from view; spikelets mostly 3-6 mm long; lemmas glabrous between the

318. Poa annua* L., Sp. Pl. 1: 68. 1753.

FIGURE 204

Plants usually annual, rarely surviving for a second season; not rhizomatous, sometimes stoloniferous, densely tufted; basal branching intravaginal, innovations common, similar to the culms. Culms 2-20(45) cm tall, prostrate to erect, slender; nodes terete, usually 1 exserted. Sheaths closed for about 1/3 their length, terete or weakly compressed, smooth; ligules 0.5–3(5) mm long, smooth, glabrous, decurrent, obtuse to truncate; blades 1-10 cm long, 1-3(6) mm wide, flat or weakly folded, thin, soft, smooth, margins usually slightly scabrous, apex broadly prow-shaped. Panicles 1–7(10) cm long, lengths 1.2–1.6 times widths, erect; nodes with 1-2(3) branches; branches ascending to spreading or reflexed, straight, terete, smooth, with crowded or loosely arranged spikelets. Spikelets 3-5 mm long, laterally compressed; florets 2-6; rachilla internodes smooth, glabrous, concealed or exposed, distal internodes less than ½(¾) the length of the distal lemma; glumes smooth, distinctly keeled, keels smooth; lower glumes 1-veined; upper glumes shorter than or subequal to the lowest lemma; calluses glabrous; lemmas 2.5-4 mm long, lanceolate, distinctly keeled, smooth throughout, the keels, marginal veins, and, usually, lateral veins crisply puberulent to long-villous, rarely glabrous throughout, lateral veins prominent, intercostal regions glabrous, margins smooth, glabrous, apex obtuse to acute; palea keels smooth, usually short- to long-villous, rarely glabrous; anthers 0.6-1.1 mm long, oblong prior to dehiscence, those of the upper 1–2 florets usually vestigial. 2n = 28.

DISTRIBUTION AND HABITAT. *Poa annua* is one of the world's most widespread weeds. It thrives in anthropomorphic habitats outside the Arctic. A native of Eurasia, it is now well established throughout most of Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: S of Creel, S of the arroyo crossing on the old road below San Ignacio, 20 May 1973, 2250 m, Bye 3773 (NMC); Creel, 20 Sep 2003, Tenorio, J. FIGURE 205

Plants usually annual, rarely longer-lived; densely tufted, tuft bases narrow, usually without sterile shoots, not stoloniferous, not rhizomatous; basal branching intravaginal. Culms (2)5-60 (70) cm tall, 0.3-1 mm thick, usually erect, bases rarely geniculate; nodes terete, usually 1 exserted. Sheaths closed for 1/4-1/2 their length, usually compressed and keeled, smooth or the keels scabrous; ligules 2-6 mm long, smooth or scabrous, usually decurrent, obtuse to acute; blades 1.5–5 mm wide, flat, thin, soft, finely scabrous, apex broadly prow-shaped, cauline blades (1)4–15 cm long, flag leaf blades usually 1–4 cm long. Panicles (1)5-15 cm long, erect, cylindrical, contracted, sometimes interrupted, congested, with 2-3(5) branches per node; branches erect or steeply ascending, smooth or sparsely to densely scabrous. Spikelets 4–7 mm long, laterally compressed; florets 3–7; rachilla internodes to 1 mm long, smooth, glabrous; glumes subequal, distinctly keeled, keels and sometimes the lateral veins scabrous; lower glumes 1(3)-veined; upper glumes shorter than or subequal to the lowest lemmas; calluses webbed; lemmas 2.6-4.2 mm long, lanceolate, distinctly keeled and smooth, keels, marginal veins, and sometimes the lateral veins short- to long-villous, keels hairy to near the apex, marginal veins to \(^2\)3 their length, lateral veins obscure to moderately prominent, intercostal regions glabrous or softly puberulent, upper margins white, apex acute; palea keels softly puberulent to short-villous at midlength, scabrous near the apex, intercostal regions usually softly puberulent; anthers 1–3, 0.2–1 mm long. 2n = 28, 28 + I.

DISTRIBUTION AND HABITAT. *Poa bigelovii* grows in arid upland regions, particularly on shady, rocky slopes in the southwestern United States and northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ascensión: Canyon in N face of Sierra Rica, S of Rancho La Consolación, 3 May 1973, matorral [scrub], 1400–2000 m, M.C. Johnston, T.L. Wendt & F. FIGURE 206

Perennial; densely to loosely tufted, rhizomatous, often weakly so, rhizomes usually short and inconspicuous; basal branching mainly intravaginal, usually some extravaginal. Culms 15-70 cm tall, sometimes stout, erect or the bases decumbent, terete or weakly compressed; nodes terete, 0-1 exserted. Sheaths closed for about 1/3 their length, terete, smooth or scabrous, glabrous or occasionally retrorsely pubescent, bases of basal sheaths glabrous, distal sheath lengths usually (5)9+ times blade lengths; collars smooth or scabrous, glabrous or hirsute; ligules 0.2-18 mm long, smooth or scabrous, decurrent or not, apex truncate to acuminate, ciliolate or glabrous; innovation blades usually moderately to densely scabrous or hirsute on and between the veins, infrequently nearly smooth and glabrous; cauline blades strongly reduced in length distally, (0.5)1-3(4) mm wide, usually involute, moderately thick and firm, infrequently moderately thin, abaxial surfaces usually smooth, infrequently scabrous, apex narrowly prow-shaped, steeply reduced in length distally along the culm, flag leaf blades often absent or very reduced, sometimes to 1(3) cm. Panicles 2-12(30) cm long, erect, contracted, narrowly lanceoloid to ovoid, congested, frequently with 100+ spikelets; nodes with 1-2 branches; branches 1-8 cm long, erect, terete to weakly angled, smooth or scabrous, with 3-15(25) spikelets. Spikelets (3)4-8(12) mm long, lengths to 3 times widths, broadly lanceolate to ovate, laterally compressed, not sexually dimorphic; florets 2-7(13); rachilla internodes 0.8-1.3 mm long, smooth, glabrous or hairy, hairs to 0.3 mm long; glumes lanceolate, distinctly keeled; lower glumes 1- to 3-veined, distinctly shorter than the lowest lemmas; calluses glabrous; lemmas 3-6 mm long, lanceolate, distinctly keeled, keels, marginal veins, and lateral veins glabrous or short- to long-villous or softly puberulent, lateral veins moderately prominent, intercostal regions softly puberulent or glabrous, smooth or sparsely scabrous, margins glabrous, apex acute; palea keels scabrous, sometimes softly puberulent or long-villous at midlength, hairs to 0.4 mm long; anthers vestigial (0.1–0.2 mm) or 2–3 mm long. 2n = 28+ II, 56, 56-58, 58-64.

DISTRIBUTION AND HABITAT. *Poa fendleriana* grows on rocky to rich slopes in sagebrush scrub, interior chaparral, high plains grasslands to forests and from desert hills to low alpine habitats. Its range extends from British Columbia to Manitoba and south to Mexico.

Poa fendleriana subsp. fendleriana

DISTRIBUTION AND HABITAT. The subspecies is found throughout the range of the species. In Mexico the subspecies is found in Bajo California, Chihuahua, Coahuila, and Sonora (Soreng and Peterson 2012).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ascensión: Canyon in N face of Sierra Rica, S of Rancho La Consolación, 3 May 1973, Matorral [scrub], 1400–2000 m, M.C. Johnston, T.L. Wendt & F. Chiang 10777 (MEXU). Bocoyna: On N-facing slope along Río Oteros, W of Creel, 6 May 1973, pine–oak forest, Bye 3675 (MEXU). Guerrero: Barranca del Cobre, SE of Creel 28 mi, N of Rio Urique crossing, 2135 m, 14 Apr 1984, Soreng 2312 & R.W. Tomachic, 4.2 mi E on road from La Junta to Yecora, 2135 m, 13 Apr 1984, Soreng 2306 & Spellenberg (US).

321. Poa matri-occidentalis subsp. mohinorensis Soreng & P. M. Peterson, Sida 22(2): 211. 2006.

FIGURE 207

Perennial; tufted, sub-rhizomatous. Culms 45–80 cm tall, erect or slightly decumbent, leafy, terete or weakly compressed, smooth. Sheaths compressed, distinctly keeled with a short wing to 0.5 mm deep, smooth, glabrous, margins fused 66%–80% the length; collars smooth or lightly scabrous or ciliate; ligules 3.5–6 mm long, scarious-white to hyaline, apex obtuse to acute, entire; blades mostly 10–30 cm long, 2–6 mm wide, flat, to broad-V

shaped, thin, lax, abaxial surface and margins lightly scabrous along the veins, adaxially smooth, glabrous, apex narrowly prow-tipped; mid-cauline blades 20-30 cm long; flag leaf blades 12-22 cm long. Panicles 12-26 cm long, nodding, open, pyramidal, sparse, with 24-85 spikelets; rachis with (1)2(3) branches per node; primary branches ascending to spreading, slender, flexuous, lax, angled, angles sparsely to moderately scabrous; lateral pedicels as long as spikelets, scabrous; longest branches 5.5-10 cm long, with 3-15 spikelets in the distal 1/3-1/2. Spikelets 4-8 mm long, 1.8-2.7 mm wide, broadly lanceolate, laterally compressed, not bulbiferous, greenish to stramineous; florets 2-3, bisexual; rachilla internodes terete, 1-2 mm long, usually hidden, smooth, glabrous; glumes lanceolate, sub-lustrous, equal to subequal, distinctly keeled, keels scabrous distally, edges smooth or lightly scabrous, apex narrowly acute; lower glumes 3-5 mm long, (1)3-veined, narrowly lanceolate; upper glumes 3.7-5.6 mm long, distinctly 3-veined, lanceolate to oblanceolate; calluses dorsally webbed, the hairs 2-3 mm long, woolly; lemmas 4.6-6.3 mm long, lanceolate, 5-veined, green, distinctly keeled, keel and marginal veins glabrous, sparsely puberulent or scabrous, upper margins narrowly scarious-hyaline, apex acute, sometimes briefly purple and bronze tinged; paleas 4.4-6 mm long, usually distinctly shorter than the lemma, keels long scabrous between keels. Flowers chasmogamous; lodicules (0.3)0.6-0.8 mm long, broadly lanceolate to ovate, with a lateral lobe; anthers 2-2.2 mm long, infrequently those of distal flower abortive. Caryopsis 2.6–3 mm long, fusiform in side view, laterally compressed, light brown to olivaceous, grain adherent to the palea.

DISTRIBUTION AND HABITAT. Poa matri-occidentalis P. M. Peterson & Soreng is found on moist rocky ledges and cliffs associated with Juniperus, Pinus, Abies, and Picea at 2,950–3,300m. It flowers from August to October. Poa matri-occidentalis has two subspecies; P. matri-occidentalis subsp.. mohinorensis is endemic to Chihuahua.

Specimens Examined. MEXICO. Chihuahua. Guadalupe y Calvo: Sierra Mohinora, near Cumbre Mohinora, 3250–3300 m, 13 Sep 2006, P.M. Peterson 20048, 20049, F. Sánchez Alvarado & E.P. Gómez Ruíz (US); 16–17 Oct 1959, D.S. Correll 23177 & H.S. Gentry (LL); Cerro Mohinora, the northern side of the hill, 2 Nov 2007, pine forest, 3090 m, D. Stancik & S. Gonzalez 6187 (MEXU); N side of Cerro Mohinora, Ca. 13 mi SW of Guadalupe y Calvo, 20 Aug 1988, 3200 m, G.L. Nesom & J.A. McDonald s.n. (ARIZ).

322. Poa pratensis L., Sp. Pl. 1: 67-68. 1753.

FIGURE 208

Perennial; green or anthocyanic, sometimes glaucous; extensively rhizomatous, densely to loosely tufted or the shoots solitary. Culms 5–70(100) cm long, erect or the bases decumbent, nodes terete or weakly compressed, 1–2(3) exposed. Sheaths closed for ½–½ their length, terete to slightly compressed, glabrous or sparsely to moderately hairy, glabrous, not swollen; collars smooth, glabrous; ligules 0.9–2(3.1) mm long, smooth

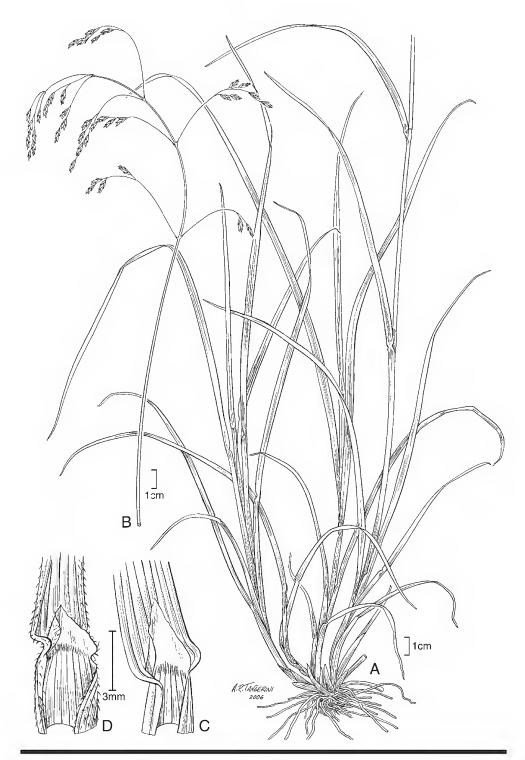

FIGURE 207. Poa matri-occidentalis. A. Habit. B. Culm and inflorescence. C. Ligule. Poa matri-occidentalis subsp. mohinorensis. D. Ligule. Drawn by Alice R. Tangerini for Smithsonian Institution, Department of Botany.

or scabrous, truncate to rounded, ciliolate or glabrous; blades of extravaginal innovations like those of the culms, those of the intravaginal shoots sometimes distinctly narrower, 0.4-1 mm wide, flat to involute; cauline blades 0.4-4.5 mm wide, flat, folded, or involute, soft and lax to moderately firm, smooth, glabrous or sparsely scabrous, frequently sparsely hairy, the hairs 0.2-0.8 mm long, erect to appressed, slender, curving, sinuous or straight, apex usually broadly prow-shaped, blades subequal; middle blades longest; flag leaf blades 1.5-10 cm long. Panicles 2-15(20) cm long, narrowly ovoid to narrowly or broadly pyramidal, loosely contracted to open, sparse to moderately congested, with (25)30-100+ spikelets and (1)2-7(9) branches per node; branches (1)2-9 cm long, spreading early or late, terete or angled, smooth or sparsely to moderately densely scabrous, with 4-30(50) spikelets usually fairly crowded in the distal ½. Spikelets 3.5-6(7) mm long, lengths 3.5 times widths, laterally compressed, sometimes bulbiferous; florets 2–5, usually normal, sometimes bulb-forming; rachilla internodes usually shorter than 1 mm long, smooth, glabrous; glumes unequal to subequal, usually distinctly shorter than the adjacent lemmas, narrowly lanceolate to lanceolate, infrequently broadly lanceolate, distinctly keeled, keels usually sparsely to densely scabrous, infrequently smooth; lower glumes 1.5–4(4.5) mm long, usually narrowly lanceolate to lanceolate, occasionally sickle-shaped, 1- to 3-veined; upper glumes 2-4.5(5) mm long, distinctly shorter than to nearly equaling the lowest lemmas; calluses dorsally webbed, sometimes with additional webs below the marginal veins, hairs at least ½ as long as the lemmas, crimped; lemmas 2-4.3(6) mm long, lanceolate, green or strongly purple-tinged, distinctly keeled, keels and marginal veins long-villous, lateral veins usually glabrous, infrequently short-villous to softly puberulent, lateral veins prominent, intercostal regions glabrous, lower portion smooth or finely muriculate, upper portion smooth or sparsely scabrous, margins narrowly to broadly hyaline, glabrous, apex acute; paleas scabrous, keels sometimes softly puberulent, intercostal regions narrow, usually glabrous, rarely sparsely hirsute; anthers usually 1.2-2 mm long, infrequently aborted late in development. 2n = 27, 28, 32, 35, 37, 41-46, 48-147.

DISTRIBUTION AND HABITAT. *Poa pratensis* is uncommon in our area but widespread and well established in North America. Soreng and Peterson (2012) separate it into five subspecies, and the only one present in Chihuahua is *Poa pratensis* subsp. *pratensis*.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: Camino Balleza-Guachochic, km 45, 24 Sep 1981, pastizal amacollado arborescente [grassy pasture], *R. Fierro & M.E.*

323. *Poa strictiramea* Hitchc., Contr. U.S. Natl. Herb. 17(3): 375. 1913.

FIGURE 209

Perennial; densely tufted, not stoloniferous, not rhizomatous; basal branching intravaginal. Culms 30-90 cm tall, slender to coarse. Sheaths closed for 1/20-1/10 their length, terete, scabrous, glabrous; collars smooth to scabrous; ligules 0.5-4(6) mm long, scabrous, apex truncate to acute, entire or lacerate; innovation blades 15-30 cm; cauline blades 1-4 mm wide, involute or rarely flat, moderately thick and firm, both surfaces sparsely to densely antrorsely scabrous, apex narrowly prow-shaped; flag leaf blades usually longer than their sheaths. Panicles (7)10-30 cm long, erect, pyramidal, open, with 2–5 branches per node; branches 2-8(15) cm long, spreading, straight, angled, moderately to densely scabrous, sometimes densely scabrous all over, with 10-30 spikelets. Spikelets 4-7 mm long, lanceolate, laterally compressed; florets 2-5; rachilla internodes 0.8-1.5 mm long, smooth or scabrous, sometimes sparsely hirsute; glumes sparsely to rarely densely scabrous; lower glumes 1- to 3-veined; calluses usually glabrous, rarely sparsely short-webbed; lemmas 2.5-3.5 mm long, lanceolate, distinctly keeled, smooth or sparsely to densely scabrous, keels and marginal veins glabrous or softly puberulent or short to long villous, lateral veins moderately prominent to prominent, intercostal regions usually glabrous, infrequently sparsely softly puberulent, apex acute; palea keels scabrous; anthers 2.2-2.5 mm long or aborted late in development. 2n = 28 + I, 28-29 + II.

DISTRIBUTION AND HABITAT. Poa strictiramea grows on shady, upland mountain slopes, usually below north facing cliffs. It ranges from the United States to Mexico in and around the Chihuahuan Desert in Chihuahua, Coahuila, Durango, and Nuevo León.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: On slopes above Rio Oteros W of Creel, 16 Oct 1977, 2200 m, Bye & W.A. Weber 8242 (MEXU). Cusihuiriachic: Montaña La Bufa, arriba [above] de Cusihuiriachic, 2 Sep 1887, C.G. Pringle 1437 (MEXU, US), type. Guachochi: Cusihuiriachic, N-facing slopes below La Buffa, 14 Apr 1984, 2350 m, Soreng & Spellenberg 2308 (NMC). Madera: San Jose de Babicora, 3 km W of Pina Blanca on road to Madera, El Diablo Pass, 13 Apr 1984, 2250 m, Soreng & Spellenberg 2304 (NMC); 1.5 km al NE de Col. Chihuichupa, 4 May 1992, bosque de pino [pine forest], 2240 m, E. Guízar 2663 (CIIDIR, MEXU).

Polypogon Desf.

Annual or perennial; not rhizomatous. Culms 4–120 cm tall, erect to decumbent, rooting at the lower nodes, sparingly branched near the base. Leaves usually no more than 5 per culm, basal and cauline; sheaths open, smooth or scaberulous;

auricles absent; ligules membranous or hyaline, acute to broadly rounded, erose, ciliate; blades flat to convolute. Inflorescence a terminal panicle, dense, continuous or interrupted below; branches flexible, usually some longer than 1 cm; pedicels absent

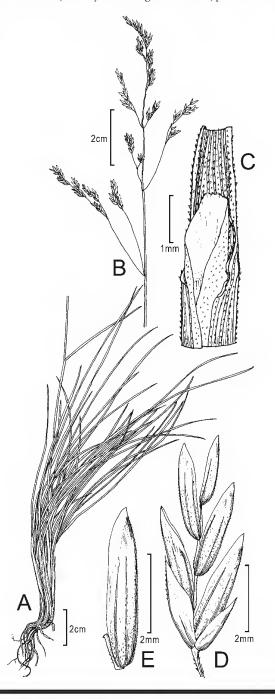

FIGURE 209. *Poa strictiramea*. A. Habit. B. Inflorescence. C. Ligule. D. Spikelet. E. Floret. Drawn by Sandy Long; copyright Utah State University.

and the spikelets borne on a stipe, or present and terminating in a stipe; stipes scabrous, flaring distally; disarticulation at the base of the stipes. Spikelets 1–5 mm long, weakly laterally compressed, with 1 bisexual floret; rachillas not prolonged beyond the base of the floret; glumes exceeding the floret, lanceolate, bases not fused, apex entire to emarginate or bilobed, usually awned from the sinuses or apex, awns flexuous, glabrous, sometimes unawned; lemmas 1- to 3(5)-veined, often awned,

awns usually terminal or subterminal, sometimes arising from just above midlength; paleas from $\frac{1}{3}$ as long as to equaling the lemmas; lodicules 2, oblong-lanceolate to lanceolate; anthers 3; ovaries glabrous; styles separate. Caryopsis slightly flattened, broadly ellipsoid to oblong-ellipsoid; hila $\frac{1}{4}$ as long as the caryopsis, ovate. x = 7.

Polypogon is a pantropical and warm-temperate genus of about 14 species (Soreng et al., 2017b).

KEY TO SPECIES OF POLYPOGON

- 1. Inflorescence a spread panicle, ellipsoid or pyramidal, often interrupted on the base; spikelets awned or awnless; perennia plants.

324. *Polypogon elongatus* Kunth, Nov. Gen. Sp. (quarto ed.) 1: 134–135. 1815.

FIGURE 210

Perennial; often flowering the first year. Culms to 100 cm tall, erect or decumbent at the base. Sheaths smooth, glabrous; ligules 4–8 mm long, scaberulous, lacerate; blades 10–30 cm long, 4–15 mm wide. Panicles 10–30 cm long, erect or nodding, interrupted, dense; pedicels not developed; stipes 1.5–2.5 mm long; glumes 3–5 mm long, hirsute, tapering from about midlength to the acute apex, apex unlobed, awned, the awns 1–3 mm long; lemmas about 1.5 mm long, awned, the awns 1–2 mm long, arising from above midlength; paleas $\frac{1}{2}$ – $\frac{2}{3}$ as long as the lemmas; anthers 0.5–0.7 mm long. 2n = 28, 56.

DISTRIBUTION AND HABITAT. *Polypogon elongatus* is native from Mexico to Argentina. It has two varieties: *Polypogon elongatus* var. *elongatus*, which is widely distributed, and *P. elongatus* var. *strictus* E. Desv. from southern Chile (Finot et al., 2013).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: Cañada de Recogoata, 23 Sep 1997, bosque de pinoencino [pine-oak forest], 1900 m, B. Tah V. 60-A (MEXU). Camargo: 5 km W of cd. Camargo, 5 Aug 1939, L. 325. Polypogon monspeliensis* (L.) Desf., Fl. Atlant. 1: 67. 1798. Alopecurus monspeliensis L., Sp. Pl. 1: 61. 1753.

FIGURE 211

Annual. Culms 5–65 (100) cm tall, erect to geniculately ascending. Sheaths glabrous, the uppermost sheaths sometimes inflated; ligules 2.5–16 mm long; blades 1–20 cm long, 1–7 mm wide. Panicles 1–17 cm long, narrowly ellipsoid, dense, sometimes lobed, greenish; pedicels absent or to 0.2 mm long; stipes 0.1–0.2 mm long; glumes 1–2.7 mm long, hirsute throughout, the largest prickles restricted to the lower $\frac{1}{2}$, apex rounded, lobed, lobes 0.1–0.2 mm long, $\frac{1}{2}$ 0 or less the length of the glume body, awned from the sinus, the awns 4–10 mm long, yellowish; lemmas 0.5–1.5 mm long, glabrous, awned, the awns 0.5–1(4.5) mm long; paleas subequal to the lemmas; anthers 0.2–1 mm long. 2n = 14, 28, 35, 42.

DISTRIBUTION AND HABITAT. Polypogon monspeliensis is native to southern Europe and Turkey. It is now a common weed throughout the world, including much of Mexico. It grows in damp to wet, often alkaline soils, particularly in disturbed areas.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Camargo: 5 km W of cd. Camargo, 5 Aug 1939, *L. H. Harvey* 1405 (US). Agrostis semiverticillata (Forssk.) C. Chr.

FIGURE 212

Perennial; often flowering the first year. Culms 10-90 cm long, sometimes decumbent and rooting at the lower nodes. Sheaths glabrous, smooth; ligules to 5 mm long; blades 2-13 cm long, 1-6 mm wide. Panicles 2-10 cm long, ovate-oblong to pyramidal, dense but interrupted, pale green to purplish; pedicels not developed; stipes 0.1-0.6 mm long; glumes 1.5-2 mm long, scabrous on the back and keel, apex obtuse or truncate, unawned; lemmas about 1 mm long, erose, unawned; paleas subequal to the lemmas; anthers 0.3-0.5 mm long. 2n=28,42.

DISTRIBUTION AND HABITAT. Polypogon viridis grows in mesic habitats associated with rivers, streams, and irrigation ditches. It is native from southern Europe to Pakistan but is now established in America, particularly the southwestern United States and Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: Cañada de Recogoata, 23 Sep 1997, bosque de pinoencino en cañada [pine-oak forest in glen], 1900 m, B. Tah V. 60, 67 (MEXU). Chiang 11344 (MEXU). Jiménez: 2 km W of Cd. Jiménez, 28 Jul 1939, L. H. Harvey 1315 (US). Temosachi: Temosachi, 23 May 1987, 1800 m, Laferr. 494 (MEXU).

Schismus P. Beauv.

Annual or short-lived perennials; tufted. Culms sometimes decumbent, glabrous. Sheaths open, usually shorter than the internodes, with tufts of hairs on the margins of the collars; auricles absent; ligules membranous, ciliate; blades flat or folded, becoming involute on drying. Inflorescence a terminal, dense panicle, branches 1 or 2 per node; disarticulation initially above the glumes, glumes and pedicels sometimes falling together later. Spikelets with (4)5–7(10) florets; glumes subequal, exceeding or exceeded by the distal floret, 3- to 7-veined, margins hyaline; lemmas 7- to

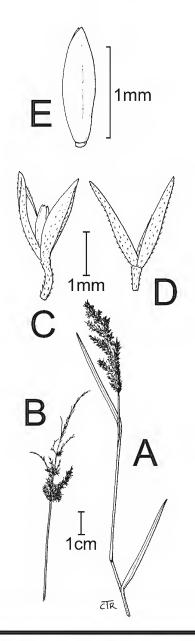

FIGURE 212. *Polypogon viridis*. A. Culm and inflorescence. B. Inflorescence. C. Spikelet. D. Glumes. E. Floret. Drawn by Cindy Roché; copyright Utah State University.

9-veined, margins and intercostal regions usually pubescent, varying to glabrous, margins hyaline, apex bifid or merely notched, sinuses sometimes mucronate; paleas spatulate, membranous, 2-veined, 2-keeled; anthers 3. Caryopsis ovoid. x = 6.

Schismus is a genus of five species that is native to Africa and Asia. Two species are established in North America.

KEY TO SPECIES OF SCHISMUS

327. Schismus arabicus* Nees, Fl. Afr. Austral. Ill. 422. 1841.

Annual. Culms (2)6–16 cm tall. Ligules 0.5–1.5 mm long, of hairs; blades 4–6 cm long, 0.5–2 mm wide, abaxial surfaces glabrous or sparsely pubescent, adaxial surfaces sparsely to densely pubescent. Panicles (1)2–3.5 cm long. Spikelets 5–7 mm long; lower glumes 4.2–6.2 mm long, equaling or exceeding the distal florets; upper glumes 4–6 mm long; lemmas 1.8–2.6 mm long, with dense, spreading pubescence between the veins, lobes longer than wide, acute to acuminate; paleas 1.5–2.2 mm long, shorter than the lemmas; anthers 0.2–0.5 mm long. Caryopsis 0.5–0.8 mm long, 2n = 12.

DISTRIBUTION AND HABITAT. Schismus arabicus is native to southwestern Asia and is established in the southwestern United States to northwestern Mexico (Baja California, Chihuahua, and Sonora), growing in open and disturbed sites (Dávila et al., 2006).

SPECIMENS EXAMINED. MEXICO. Chihuahua. **Juárez**: por la carr. [hwy] Méx 2, en los alrededores [surroundings] de San Agustín, 29 km al SE de Cd. Juárez, 18 Mar 1995, en suelos arenosos [sandy soil], 1120 m, *R. Corral, P. Olivas & E. Pérez RCD6065* (UACJ).

328. *Schismus barbatus** (Loefl. ex L.) Thell., Bull. Herb. Boissier, sér. 2. 7(5): 391. 1907. *Festuca barbata* Loefl. ex L., Demonstr. Pl. 3. 1753.

Annual. Culms 6–27 cm tall. Ligules 0.3–1.1 mm long, of hairs; blades 3–15 cm long, 0.3–1.5 mm wide, abaxial surfaces glabrous or scabrous, adaxial surfaces scabrous, sparsely long-pubescent near the ligules. Panicles 1–6(7.5) cm long. Spikelets 4.5–7 mm long; lower glumes 4–5.2 mm long, exceeded by the distal florets; upper glumes 4–5.3 mm long; lemmas 1.5–2(2.5) mm long, with sparse, appressed pubescence between the veins, or glabrous and with spreading hairs on the margins, lobes as wide as or wider than long, acute to obtuse; paleas 1.7–2.2(2.6) mm long, those of the lower florets in the spikelets as long as or longer than the lemmas; anthers 0.2–0.4 mm long. Caryopsis 0.6–0.8 mm long. 2n = 12.

DISTRIBUTION AND HABITAT. Schismus barbatus is native to Eurasia and is established in the southwestern United States and northwestern Mexico (Baja California, Baja California Sur, Chihuahua, and Sonora), growing in sandy sites and dry riverbeds often along disturbed roadsides and fields (Dávila et al., 2006).

Schizachyrium Nees

Annual or perennial; caespitose or rhizomatous, sometimes both caespitose and short rhizomatous. Culms branched above the bases, often purplish near the nodes. Leaves not aromatic, sheaths open; auricles usually absent; ligules membranous; blades flat, folded, or involute, those of the uppermost leaves often greatly reduced. Inflorescences axillary and terminal, of 1, rarely 2, rames, peduncles subtended by a modified leaf, rames not reflexed, with spikelets in heterogamous sessile-pedicellate spikelet pairs; pedicels free of the rame axes, usually pubescent; internodes more or less flattened, filiform to clavate, without a median groove, apex cupulate or fimbriate; disarticulation in the rame axes, below the sessile spikelets. Spikelets somewhat dorsoventrally compressed. Sessile spikelets with 2 florets; glumes exceeding the florets, lanceolate to linear, membranous; lower glumes enclosing the upper glumes, convex, weakly 2-keeled, with several (sometimes inconspicuous) intercostal veins; lower florets reduced to hyaline lemmas; upper florets bisexual, lemmas hyaline, bilobed or bifid to % of their length (rarely entire), awned from the sinuses; anthers 3; pedicellate spikelets usually shorter than to as long as the sessile spikelets, occasionally longer, sterile or staminate, with 1 floret, often disarticulating as the rame matures; lemmas present in staminate spikelets, hyaline, unawned or with a straight awn. x = 10.

Schizachyrium is a genus of about 64 species that are native to tropical and subtropical regions of the world; 9 are native to North America.

KEY TO SPECIES OF SCHIZACHYRIUM

- 1. Plants perennial; culms 40–150 cm tall.

 - 2. Leaf blades (1)1.5–9 mm wide, without a longitudinal stripe of white, spongy tissue on their adaxial surfaces; plants caespitose or rhizomatous; pedicellate spikelets equal to or smaller than the sessile spikelets.

- 3. Pedicellate spikelets 0.7–10 mm long, usually shorter than the sessile spikelets, sterile, unawned or awned, the awns up to 6 mm long.
 - 4. Upper lemmas cleft for 1/3-1/8 of their length; lower glumes glabrous or pubescent S. sanguineum

329. Schizachyrium brevifolium (Sw.) Nees ex Büse, Pl. Jungh. 3: 359. 1854.

Annual. Culms 5-40(60) cm tall, prostrate, slender. Sheaths shorter than internodes; ligules a ciliolate membrane; blades 1-6 cm long, 1-7 mm wide, apex obtuse; inflorescences composed of 1 raceme, the raceme 1-2.5 cm long, terminal and axillary, subtended by a linear spatheole; rachis fragile at the nodes, semiterete, glabrous or ciliate on margins. Spikelets in pairs, 1 bisexual, sessile, 1 sterile, pedicelled, pedicels glabrous or ciliate; sterile spikelets 1-1.5 mm long, rudimentary, lanceolate, dorsally compressed, shorter than bisexual spikelet, deciduous with the bisexual spikelet, glumes chartaceous, 1 glume awned, the awn 3-6 mm long; bisexual spikelets 2-4 mm long, with 2 florets, 1 basal sterile and 1 fertile, lanceolate, laterally compressed, callus pilose; glumes 2-4 mm long, equal, exceeding apex of florets, firmer than fertile lemma; lower glumes lanceolate, coriaceous, 2-keeled, keeled above and frontally, glabrous or pilose; upper glumes lanceolate, membranous, 1-keeled, apex acuminate; sterile floret lemma oblong, hyaline, 2-veined; fertile lemma oblong, hyaline, without keels, apex entire when awnless, or 2-lobed, mostly awned to rarely muticous, lemma awn 7-12 mm long, from a sinus, geniculate with twisted column, column glabrous; palea absent or minute; anthers 3, 0.5-1 mm long.

DISTRIBUTION AND HABITAT. Schizachyrium brevifolium is native in tropical Africa and Asia and naturalized in America from Mexico to South America. It has been reported in Chihuahua (Espejo Serna et al, 2000).

330. Schizachyrium cirratum (Hack.) Wooton & Standl., New Mexico Agric. Exp. Sta. Bull. 81: 30. 1912. Andropogon cirratus Hack., Flora 68(7): 119. 1885.

FIGURE 213

Plants caespitose or short rhizomatous. Culms 31-75 cm tall, often decumbent, not rooting or branching at the lower nodes, glabrous, glaucous, sometimes purplish. Ligules 1-2.5 mm long; blades 6-17 cm long, 2-4 mm wide, glabrous, without a longitudinal stripe of white, spongy tissue. Inflorescence rames 4-6 cm long, usually exserted, straight, often somewhat stiff, not flexuous, appearing linear; internodes straight, with a tuft of hairs near the base, elsewhere glabrous or ciliate on the margins. Sessile spikelets 8–10 mm long; calluses 0.3–0.6 mm long, the hairs 0.5-1.2 mm long; glumes glabrous or scabrous; awns 13-24 mm long; pedicels 3.5-5 mm long, 0.2-0.5 mm wide at the base, widening to 0.5-1 mm near apex, straight, with a tuft of hairs at the base, distal ½ usually ciliate on 1 side, sometimes on both sides; pedicellate spikelets 6-8 mm long, about as long as the sessile spikelets, usually staminate, sometimes sterile, unawned. 2*n*= 20.

DISTRIBUTION AND HABITAT. Schizachyrium cirratum grows on rocky slopes, mostly at elevations of 1,600 m or higher; it occurs from southern California to western Texas into Mexico and is found in South America.

Schizachyrium hirtiflorum Nees, Schizachyrium semiglabrum Nash.

FIGURE 214

Plants caespitose. Culms 40-120 cm tall, erect, not rooting or branching at the lower nodes, glabrous. Sheaths glabrous, rounded; ligules 0.7-2 mm long; blades 7-20 cm long, 1-6 mm wide, usually with long, papillose-based hairs basally, glabrous elsewhere, sometimes scabrous, without a longitudinal stripe of white, spongy tissue. Peduncles 4-6 cm long; rames 4-15 cm long, not open, usually almost fully exserted at maturity; internodes 4-6 mm long, straight, from mostly glabrous with a tuft of hairs at the base to densely hirsute all over. Sessile spikelets 5-9 mm; calluses 0.5-1 mm long, the hairs to 2 mm long; lower glumes glabrous or densely pubescent; upper lemmas cleft for (3/3)3/4-7/8 of their length; awns 15-25 mm long; pedicels 3-6 mm long, 0.3-0.5 mm wide at the base, gradually widening to about 0.6-0.8 mm at the top, straight; pedicellate spikelets 3-5 mm long, usually evidently shorter than the sessile spikelets, sterile or staminate, awned, the awns 0.3-6 mm long.

DISTRIBUTION AND HABITAT. Schizachyrium sanguineum extends from the southern United States to Chile, Paraguay, and Uruguay.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: Yamuco at 1 km E of Hwy towards Basihuare and Creel, N of Rio Urique crossing, 26 Aug 2003, bosque de pino [pine forest], 1891 m, P.M. Peterson & P. 332. Schizachyrium scoparium (Michx.) Nash, Fl. S.E. U.S. 59, 1326. 1903. Andropogon scoparius Michx., Fl. Bor.-Amer. 1: 57. 1803.

FIGURE 215

Plants caespitose or rhizomatous, green to purplish, sometimes glaucous. Culms 7-210 cm tall, usually 1-3 mm thick, not rooting or branching at the lower nodes. Sheaths rounded or keeled, glabrous or pubescent, sometimes glaucous; ligules 0.5-2 mm long, collars neither elongate nor narrowed; blades 7-105 cm long, 1.5–9 mm wide, without a longitudinal stripe of white, spongy tissue. Peduncles 0.8–10 cm long; rames 2.5–8 cm long, partially to completely exserted, usually somewhat open; internodes 3-7 mm long, usually arcuate at maturity, ciliate on at least the distal ½ (sometimes throughout), the hairs 1.5-6 mm long. Sessile spikelets 3–11 mm long; calluses 0.5–1(2) mm long, the hairs 0.3–4 mm long; lower glumes glabrous; upper lemmas membranous throughout, cleft to ½ their length; awns 2.5-17 mm long. Pedicels 3-7.5 mm long, 0.1-0.2 mm wide at the base, flaring above midlength to 0.3-0.5 mm long, straight or curving outward. Pedicellate spikelets 0.7-10 mm long, sometimes shorter than the sessile spikelets, sterile or staminate, unawned or awned, awns to 4 mm long, when sterile, the lemma usually absent. 2n = 40.

DISTRIBUTION AND HABITAT. Schizachyrium scoparium is a widespread grassland species, extending from Canada to central Mexico. It is one of the principal grasses in the tallgrass prairies that used to dominate the central plains of North America. There are three varieties; only Schizachyrium scoparium var. neomexicanum (Nash) Hitchc. is found in Chihuahua (Espejo Serna et al., 2000).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 7.4 km W of Balleza on road to Guachochi, 18 Sep 1991, huizachal, 1660 m, P.M. Peterson, Annable & Valdés-Reyna 10732 (CIIDIR, US). Quintana & E. Estrada 3552 (NMC).

333. Schizachyrium tenerum Nees, Fl. Bras. Enum. Pl. 2: 336. 1829. Andropogon tener (Nees) Kunth, Révis. Gramin. 2: 565, t. 197. 1832.

FIGURE 216

Plants caespitose. Culms 60–100 cm tall, sometimes reclining or decumbent, glabrous. Collars not elongate, about as wide as the blade; ligules to 0.5 mm long, ciliolate; blades 5–15 cm long, 0.5–2 mm wide, involute or flat, glabrous or sparsely hairy basally, with a wide central zone of bulliform cells evident on the adaxial surfaces as a longitudinal stripe of white, spongy tissue. Rames 2–6 cm long, eventually long-exserted; internodes 2–4 mm

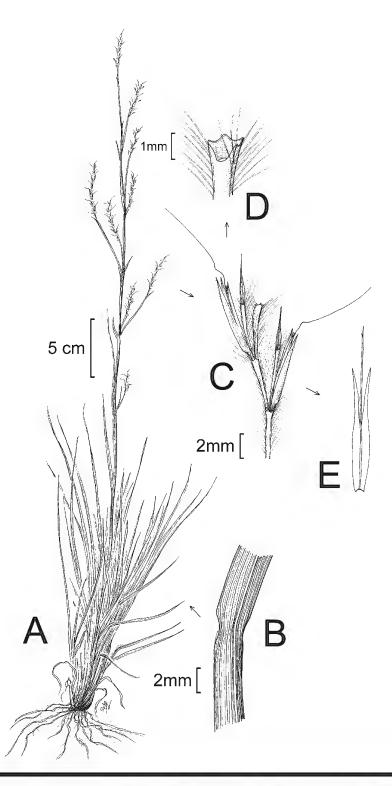

FIGURE 215. Schizachyrium scoparium var. scoparium. A. Habit. B. Collar. C. Portion of inflorescence branch. D. Distal end of spikelet pair. E. Upper lemma. Drawn by Linda Ann Vorobik; copyright Utah State University.

long, straight, glabrous. Sessile spikelets 3.5–4.5 mm long; calluses 0.5–1 mm long, the hairs to 1.2 mm long; lower glumes glabrous; upper lemmas acute, entire; awns 6–10 mm long; pedicels 3–5 mm long, glabrous. Pedicellate spikelets usually as long as or slightly longer than the sessile spikelets, sterile, unawned. 2n = 60.

DISTRIBUTION AND HABITAT. Schizachyrium tenerum is an uncommon species in the soouthwestern United States, where it grows on sandy soils in pine forest openings and coastal prairies. Its range extends to Central America and into South America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: Río Osichi Canyon at jct of Río Basihuare. Up Río Osichi Canyon, 31 Aug 2003, bosque [forest] de *Quercus-Pinus*, 1650 m, *P.M. Peterson & P. Catalán* 17626 (CIIDIR).

Scleropogon Phil.

Perennial; usually monoecious, less frequently dioecious, occasionally synoecious; bearing wiry, often arching, stolons with 5-15 cm internodes, sometimes also weakly rhizomatous. Leaves mostly basal; sheaths short, strongly veined, basal leaves commonly hirsute or villous; ligules of hairs; blades firm, flat or folded. Inflorescence terminal, usually exceeding the upper leaves, spikelike racemes or contracted panicles with few spikelets, in bisexual plants staminate and pistillate florets in the same spikelet with the staminate florets below the pistillate florets or in separate spikelets, bisexual florets occasionally produced; branches not pectinate; disarticulation above the glumes and below the lowest pistillate floret in a spikelet, florets falling together, lowest floret with a bearded, sharp-pointed callus. Staminate spikelets with 5-10(20) florets; glumes membranous, pale, 1- to 3-veined, acuminate; lemmas 3-veined, similar to the glumes, unawned or awned, awns to 3 mm long; paleas shorter than the lemmas, often conspicuously so. Pistillate spikelets appressed to the branch axes, usually the 3-5 lower florets functional, upper florets reduced to awns; glumes lanceolate, acuminate, strongly 3-veined, membranous, occasionally with a few fine accessory veins; lemmas narrow, 3-veined, veins extending into awns, the awns (30)50-100(150) mm long, spreading or reflexed at maturity. x = 10.

Scleropogon is a monotypic American genus with an amphitropical disjunct distribution (Peterson and Columbus, 1997).

334. *Scleropogon brevifolius* Phil., Anales Univ. Chile 36: 206. 1870.

FIGURE 217

Stolons to 50 cm long, wiry, internodes 5–15 cm. Culms (5)10-20 cm tall, erect. Ligules about 1 mm long; blades 2–8(12) cm long, 1–2 mm wide. Bisexual spikelets 2–4 cm long, staminate florets below the pistillate florets. Staminate spikelets 2–3 cm long. Pistillate spikelets subtended by a glume-like bract; lemma bodies 2.5–3 cm long. 2n = 40.

DISTRIBUTION AND HABITAT. Scleropogon brevifolius grows on grassy plains and flats, generally being most abundant

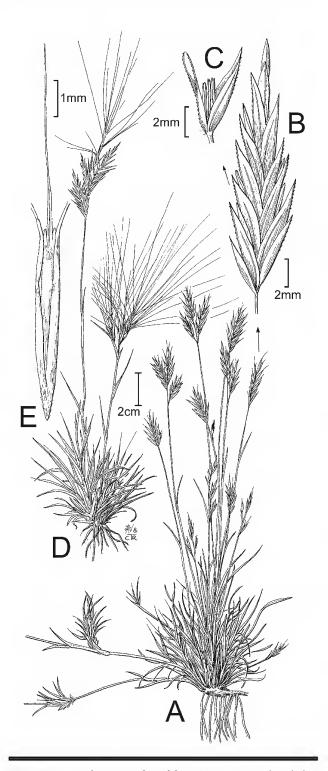

FIGURE 217. *Scleropogon brevifolius*. A. Staminate plant habit. B. Staminate spikelet. C. Staminate floret. D. Bisexual plant habit. E. Pistillate floret. Drawn by Linda Ann Vorobik and Cindy Roché; copyright Utah State University.

on disturbed or overgrazed land. Its North American range extends from the southwestern United States to central Mexico; its South American range is from Chile to northwestern Argentina.

Setaria P. Beauv.

Annual or perennial; caespitose, rarely rhizomatous. Culms erect or decumbent. Ligules membranous and ciliate or of hairs; blades flat, folded, or involute, or plicate and petiolate. Inflorescences terminal, panicles, usually dense and spikelike, occasionally loose and open; disarticulation usually below the glumes, spikelets falling intact, bristles persistent. Spikelets usually lanceoloid-ellipsoid, rarely globose, turgid, subsessile to short pedicellate, in involucres on short branches or single on a short branch, some or all subtended by 1 to several, terete bristles (sterile branchlets). Lower glumes membranous, not saccate, less than ½ as long as the spikelets, 1- to 7-veined; upper glumes membranous to herbaceous at maturity, ½ as long as to nearly equaling the upper lemmas, 3- to 9-veined; lower florets staminate or sterile; lower lemmas membranous, equaling or rarely exceeding the upper lemmas, rarely absent, not constricted or indurate basally, 5- to 7-veined; lower paleas usually hyaline to membranous at maturity, rarely absent or reduced, veins not keeled; upper florets bisexual; upper lemmas and paleas indurate, transversely rugose, rarely smooth; anthers 3, not penicillate; styles 2, free or fused basally, white or red. Caryopsis small, ellipsoid to subglobose, compressed dorsiventrally. x = 9.

Setaria, a genus of about 113 species, grows predominantly in tropical and warm-temperate regions and is particularly well represented in Africa, Asia, and South America.

KEY TO SPECIES OF SETARIA

1. Bristles 4–12 below each spikelet; panicle dense, cylindric
2. Perennial; rhizomes short and knotty
2. Annual; rhizomes absent
1. Bristles 1–3 (rarely 6) below each spikelet; panicle open, interrupted, evidently branched.
3. Bristles retrorsely scabrous; spikelets 1.5–2 mm long, with only 1 bristle, 1 or 2 times longer than the spikelet.
4. Margins of sheaths ciliate distally; blades scabrous on the abaxial surfaces; panicle branches verticilate
S. verticillata
4. Margins of sheaths glabrous; blades strigose on the abaxial surfaces; panicle branches simple or in pairs, not verticilate
3. Bristles antrorsely scabrous; spikelets 1.8-3.2 mm long, generally with more than 1 bristle, bristles usually twice as long
as the spikelets.
5. Perennial
6. Spikelets 2.8–3.2 mm long; blades densely villous
6. Spikelets 1.9–2.8(3) mm long; blades not villous.
7. Lower paleas narrow, 1/3-1/2 as long as the lemmas; spikelets elliptical; panicles 6-15 cm long, columnar; blades
2–5(8) mm wide; culms and leaves light green to glaucous
7. Lower paleas broad, subequal to the lemmas in length; spikelets subspherical; panicles 8–30 cm long, dense cylindrical; blades 7–15 mm wide; culms and leaves green-yellowish
5. Annual.
8. Upper glumes and lower lemmas with 7 veins, the outer pair of veins not coalescing with the inner 5; lower palea absent
8. Upper glumes and lower lemmas 5- to 7-veined, all of which coalesce near the apex; lower paleas present, some times reduced.
9. Panicles loosely spicate, interrupted; rachises visible, hispid; culm nodes pubescent, hairs appressed
9. Panicles densely spicate; rachises not visible, villous; culm nodes glabrous

335. Setaria adhaerens* (Forssk.) Chiov., Nuovo Giorn. Bot. Ital. 26: 77. 1919. Panicum adhaerens Forssk., Fl. Aegypt.-Arab. 20. 1775.

Annual. Culms 25-60 cm tall. Sheaths glabrous throughout; ligules 1-2 mm long, of hairs, white; blades usually less than 10 cm long, 5-10 mm wide, flat, broad basally, abaxial surfaces conspicuously strigose with papillose-based hairs, tapering abruptly at the apex; bristles solitary, about 5 mm long, retrorsely scabrous. Panicles 2-6 cm long, verticillate, green to purple; rachises retrorsely rough hispid. Spikelets 1.5-2.2 mm long; lower glumes about $\frac{1}{2}$ as long as the spikelets, obtuse, 1(3)-veined; upper glumes nearly as long as the spikelets, 5- to 7-veined; lower lemmas equaling to slightly exceeding the upper lemmas; lower paleas less than $\frac{1}{2}$ as long as the spikelets, scale-like; upper lemmas finely and transversely rugose; upper paleas similar to the upper lemmas. 2n = 18.

DISTRIBUTION AND HABITAT. Setaria adhaerans grows in subtropical regions throughout the world. In North America, it is known from the southern United States, northeastern Mexico, Guatemala, Cuba, and the Bahamas (Rominger, 2003). It appears to be introduced and has been reported for Chihuahua (Espejo Serna et al., 2000).

336. Setaria grisebachii E. Fourn., Mexic. Pl. 2: 45. 1886.

Annual. Culms 30–100 cm tall; nodes pubescent, the hairs appressed. Sheaths with ciliate margins; ligules ciliate; blades to

12(25) cm long, to 10(20) mm wide, flat, hirsute. Panicles 3–18 cm long, loosely spicate, interrupted, often purple; rachises hispid; bristles 5–15 mm long, 1–3, flexible, antrorsely scabrous. Spikelets 1.5–2.2 mm long; lower glumes about ½ as long as the spikelets, distinctly 3-veined, lateral veins coalescing with the central veins below the apex; upper glumes nearly equaling the upper lemmas, obtuse, 5-veined; lower lemmas equaling the upper lemmas; lower paleas about ½ as long as the lower lemmas, narrow; upper lemmas finely and transversely rugose; upper paleas similar to the upper lemmas.

DISTRIBUTION AND HABITAT. Setaria grisebachii is the most widespread and abundant native annual species of Setaria in the southwestern United States. It grows in open ground and extends along the central highlands of Mexico to Guatemala.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: near Chihuahua, 16 Sep 1885, C.G. Pringle 381 (US); 4 Sep 1935, LeSueur Mex-025 (US); km 14 N of Cd. Chihuahua, 15 Sep 1955, Hern.-Xol. FIGURE 218

Caespitose perennial. Culms 20–100 cm tall. Sheaths compressed, glabrous, margins villous distally; ligules 1–2.5 mm long, ciliate; blades 8–25 cm long, 2–5 mm wide, flat or folded, scabrous on both surfaces. Panicles 6–15 cm long, tightly spikelike, pale green; rachises scabrous or villous; bristles 4–15 mm long, usually solitary, ascending. Spikelets 2.1–2.8(3) mm long, elliptical; lower glumes $\frac{1}{3}$ – $\frac{1}{2}$ as long as the spikelets, 3-veined; upper glumes from $\frac{3}{4}$ as long as to equaling the florets, 5-veined; lower lemmas equaling the upper lemmas, 5-veined; lower paleas $\frac{1}{2}$ – $\frac{3}{4}$ as long as the upper paleas, lanceolate; upper lemmas apiculate, finely and transversely rugose; upper paleas similar. 2n = 54, 68, 72.

DISTRIBUTION AND HABITAT. Setaria leucopila grows in the southwestern United States and northern Mexico. It is the most common of the perennial plains bristle grasses.

338. *Setaria liebmannii* E. Fourn., Mex. Pl. 2: 44. 1886. *Setaria rariflora* J. Presl.

Annual. Culms 30–90 cm tall. Sheaths glabrous, margins ciliate; ligules ciliate; blades to 20 cm long, 10–20 mm wide, flat, scabrous on both surfaces. Panicles 10–25 cm long, loosely spicate; rachises scabrous; bristles 7–15 mm long, solitary, slender, antrorsely scabrous. Spikelets 2–2.7(3) mm long; lower glumes about $\frac{1}{3}$ as long as the spikelets, 3-veined; upper glumes and lower lemmas 7-veined, the 5 central veins coalescing at the apex; lower paleas absent; upper lemmas gibbous, strongly and coarsely transversely rugose; upper paleas similar to the upper lemmas. 2n = 18.

DISTRIBUTION AND HABITAT. Setaria liebmannii in the United States is known only from southern Arizona, but it is a common species along the Pacific slope of northern Mexico to Nicaragua (Espejo Serna et al., 2000).

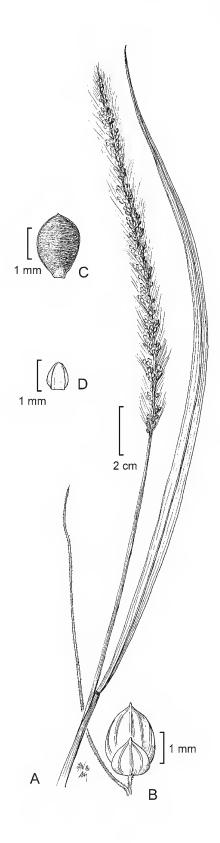

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: SW Chihuahua, Batopilas, Aug 1885, E. Palmer 52, 110D (US); Intersección Arroyo de Santiago con el Río Batopilas, 6 km antes del pueblo [before town] de Batopilas, 10 Sep 1999, 600 m, T. Lebgue, Quintana & E. Estrada 2366 (NMC). 339. Setaria macrostachya Kunth, Nov. Gen. Sp. (quarto ed.) 1: 110. 1815.

FIGURE 219

Densely caespitose perennial. Culms 60–120 cm tall, rarely branched distally, scabrous below the nodes and panicles. Sheaths keeled, glabrous, usually with a few white hairs at the throat; ligules 2–4 mm long, densely ciliate; blades 15–20 cm long, 7–15 mm wide, flat, adaxial surface scabrous. Panicles 10–30 cm long, 1–2 cm wide, uniformly thick from the base to the apex, dense, rarely lobed basally; rachises scabrous and loosely pilose; bristles 10–20 mm long, usually solitary, soft, antrorsely scabrous. Spikelets 2–2.3 mm long, subspherical; lower glumes ½–½ as long as the spikelets, 3- to 5-veined; upper glumes about ¾ as long as the spikelets, 5- to 7-veined; lower lemmas equaling the

FIGURE 219. *Setaria macrostachya*. A. Inflorescence and leaf blade. B. spikelet. C. Upper lemma. D. Lower palea. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

upper lemmas, 5-veined; lower paleas nearly equaling the upper paleas in length and width; upper lemmas transversely rugose; upper paleas convex, ovate. 2n = 54.

DISTRIBUTION AND HABITAT. Setaria macrostachya is abundant in the desert grasslands of the southwestern United States, particularly in southern Arizona and Texas. It extends south through the highlands of central Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Aldama: Santo Domingo, 50 km SW of Coyame of Mex 16 between Presidio, Texas and Chihuahua, 22 Sep 1988, 1400 m, P.M. Peterson & Annable 5751 (US); Rancho El torreño # 3, 25 Sep 1982, matorral inerme parvifolio [unarmed small-leaved scrub], 1150 m, G. Melgoza 35 (CIIDIR). 340. Setaria parviflora (Poir.) Kerguélen, Lejeunia, n.s. 120: 161. 1987. Cenchrus parviflorus Poir., Encycl. 6: 52. 1804. Setaria geniculata P. Beauv.

FIGURE 220

Perennial; with short, knotty rhizomes. Culms 30–120 cm tall; nodes glabrous. Sheaths glabrous; ligules shorter than 1 mm long, of hairs; blades to 25 cm long, 2–8 mm wide, flat, scabrous above. Panicles 3–8(10) cm long, of uniform width throughout their length, densely spikelike; rachises scabrous to hispid; bristles 2–12 mm long, 4–12, antrorsely barbed, yellow to purple. Spikelets 2–2.8 mm long, elliptical and turgid; lower glumes about $\frac{1}{3}$ as long as the spikelets, 3-veined; upper glumes $\frac{1}{2}$ -3 as long as the spikelets, 5-veined; lower florets often staminate; lower lemmas occasionally indurate and faintly transversely rugose; lower paleas equaling the lower lemmas; upper lemmas distinctly transversely rugose, often purple-tipped. 2n = 36, 72.

DISTRIBUTION AND HABITAT. Setaria parviflora is a common, native species of moist ground. It is most frequent along the Atlantic and Gulf coasts, but it also grows from the Central Valley of California east through the central United States and southward through Mexico to Central America (Rominger 2003).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: aprox. 25 km al N del poblado [village] Flores Magón, 7 Oct 1995, 1140 m, R. Corral, P. Olivas & J.O. Torres RCD6455 (UACJ). 341. Setaria pumila* (Poir.) Roem. & Schult., Syst. Veg. (ed. 15 bis) 2: 891. 1817. Panicum pumilum Poir., Encycl., Suppl. 4(1): 273. 1816.

Setaria lutescens (Weigel ex Stuntz) F. T. Hubb.

FIGURE 221

Annual. Culms 30–130 cm tall. Sheaths glabrous; ligules ciliate; blades 4–10 mm wide, flat to loosely twisted, adaxial surface with papillose-based hairs. Panicles 3–15 cm long, densely spicate, erect; rachises hispid; bristles 3–8 mm long, 4–12, antrorsely scabrous, yellowish. Spikelets 3–3.4 mm long, strongly turgid; lower glumes ½ as long as the spikelet, 3-veined, acute; upper glumes about ½ as long as the spikelet, 5-veined, ovate; lower lemmas equaling the upper lemmas; lower paleas

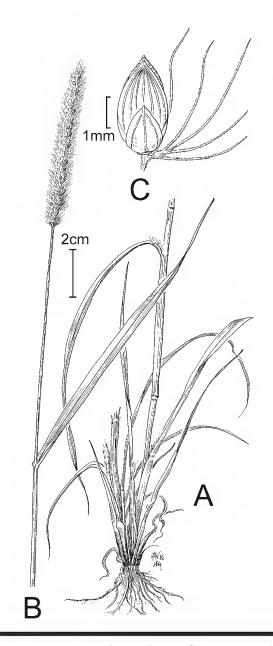

FIGURE 221. Setaria pumila. A. Habit. B. Inflorescence. C. Spikelet. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

equaling the lower lemmas; upper lemmas conspicuously exposed, strongly transversely rugose. 2n = 36, 72.

DISTRIBUTION AND HABITAT. In Chihuahua we have *Setaria pumila* subsp. *pumila*, which is a common weed of lawns and cultivated fields throughout North America to central Mexico. This subspecies is native to Eurasia.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Camargo: 5 km W of Camargo, 1220 m, 5 Aug 1939, *L.H. Harvey 1413* (US). Meoqui: Lazaro Cardenas, 7 Aug 1974, 1250 m, *C. Rodríguez*, *O. Agundis & S. Acosta 1222* (US).

342. Setaria verticillata* (L.) P. Beauv., Ess. Agrostogr. 51, 171, 178, 1812.

Annual. Culms 30–100 cm tall; nodes glabrous. Sheaths glabrous, margins ciliate distally; ligules to 1 mm long, densely ciliate; blades 5–15 mm wide, flat, abaxial surfaces scabrous. Panicles 5–15 cm long, tapering to the apex; rachises retrorsely rough hispid; bristles 4–7 mm long, solitary, retrorsely scabrous. Spikelets 2–2.3 mm long; lower glumes about $\frac{1}{2}$ as long as the spikelets, obtuse, 1(3)-veined; upper glumes nearly as long as the spikelets; lower paleas about $\frac{1}{2}$ as long as the spikelets, broad; upper lemmas finely and transversely rugose; upper paleas similar to the upper lemmas. 2n = 18, 36, 54, 72, 108.

DISTRIBUTION AND HABITAT. Setaria verticillata is a European adventive that is now common throughout the cooler regions of the contiguous United States and southern Canada and introduced to northern Mexico (Rominger, 2003). This species has been reported for Chihuahua (Dávila et al., 2006).

343. *Setaria villosissima* (Scribn. & Merr.) K. Schum., Just's Bot. Jahresber. 28(1): 417. 1902. *Chaetochloa villosissima* Scribn. & Merr., Bull. Div. Agrostol., U.S.D.A. 21: 34, f. 19. 1900.

Caespitose perennial. Culms 40–100 cm tall. Sheaths villous distally, margins ciliate; ligules about 1 mm long, densely ciliate, hairs white; blades 15–30 cm long, 5–8 mm wide, both surfaces villous. Panicles 10–20 cm long, loosely spicate; bristles 10–20 mm long, usually solitary. Spikelets 2.8–3.2 mm long; lower glumes about ½ as long as the spikelets, broadly ovate, 3-veined; upper glumes nearly equaling the spikelets, 5- to 7-veined; lower lemmas equaling the upper lemmas, 5-veined; lower paleas about ½ as long as the upper paleas, lanceolate; upper lemmas finely and transversely undulate-rugose basally, striate and punctate distally; upper paleas similar, ovate-lanceolate. 2*n* = 54.

DISTRIBUTION AND HABITAT. Setaria villosissima is a rare species that grows on granitic soils in southwestern Texas and northern Mexico. This species has been reported for Chihuahua (Espejo Serna et al., 2000; Dávila et al., 2006).

344. *Setaria viridis** (L.) P. Beauv., Ess. Agrostogr. 51: 178. 1812. *Panicum viride* L., Syst. Nat. (ed. 10) 2: 870. 1759.

FIGURE 222

Annual. Culms 20–250 cm tall; nodes glabrous. Sheaths glabrous, sometimes scaberulous, margins ciliate distally; ligules 1–2 mm long, ciliate; blades to 20 cm long, 4–25 mm wide, flat, scabrous or smooth, glabrous. Panicles 3–20 cm long, densely spicate, nodding only from near the apex; rachises hirsute and villous; bristles 5–10 mm long, 1–3, antrorsely scabrous, usually green, rarely purple. Spikelets 1.8–2.2 mm long; lower glumes about ½ as long as the spikelets, triangular-ovate, 3-veined; upper glumes

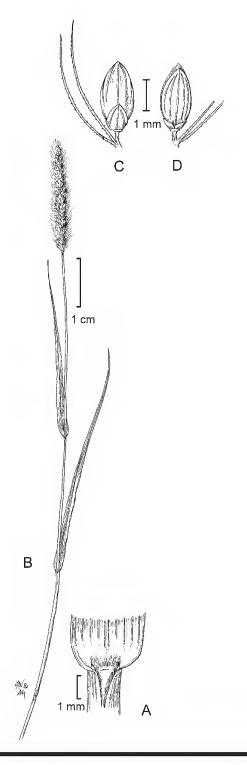

FIGURE 222. Setaria viridis. A. Ligule. B. Culm and inflorescence. C. Spikelet showing lower glume. D. Spikelet showing upper glume. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

nearly equaling the upper lemmas, elliptical, 5- to 6-veined; lower lemmas slightly exceeding the upper lemmas, 5-veined; lower paleas about $\frac{1}{3}$ as long as the lower lemmas, hyaline; upper lemmas very finely and transversely rugose, pale green, 5- to 6-veined; upper paleas similar to the upper lemmas. 2n = 18.

DISTRIBUTION AND HABITAT. *Setaria viridis* is an aggressive weed native to Eurasia (Rominger, 2003).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Manuel Benavides: entre [between] Manuel Benavides & Pocitos, 2 Aug 1976, matorral [scrub], 1454 m, *S. González & J.M. Peña 475* (RELC). Riva Palacio: km 109 carr. [hwy] Chihuahua–El Sueco, 6 Oct 1978, matorral de prosopis, 1675 m, *A. Melgoza s.n.* (CIIDIR).

Setariopsis Scribn.

Annual. Culms solid, branching above the base. Sheaths open; ligules of hairs; blades flat. Inflorescence a terminal panicle

with pilose rachises; branches with spikelets congested, shortly pedicellate, subtended by a terete bristle; disarticulation below the glumes. Spikelets dorsally compressed, with 2 florets, lower florets usually sterile, upper florets bisexual. Lower glumes about ¼ the length of spikelets, 5- to 7-veined, subclasping; upper glumes slightly shorter than the spikelets, 11- to 19-veined, indurate at maturity, constricted at the base, auriculate above the point of constriction; lower lemmas longer than the glumes, membranous but somewhat indurate at the base; lower paleas usually present, short; upper lemmas indurate, finely transversely rugose, apiculate, margins clasping the paleas; upper paleas similar to the lemmas in length and texture; lodicules 2; anthers 3, purple; ovaries glabrous; style branches 2, free to the base. Caryopsis ovate, plano-convex; embryos about ½ as long as the caryopsis. x = 9.

Setariopsis includes two species that are found in open, mostly tropical forests of North, Central, and South America.

KEY TO SPECIES OF SETARIOPSIS

- 345. *Setariopsis auriculata* (E. Fourn.) Scribn., Publ. Field Columbian Mus., Bot. Ser. 1(3): 289. 1896. *Setaria auriculata* E. Fourn., Mexic. Pl. 2: 43. 1886.

Caespitose annual. Culms 15-60 cm tall, weak, erect or ascending, glabrous or with a few short, appressed hairs on and immediately below the nodes. Sheaths mostly glabrous with soft hairs near the ligule; ligules 1-1.5 mm long; blades 3-25 cm long, 2-12 mm wide, apex acuminate, glabrous or with a few hairs on the collars. Panicles 3-15 cm long, 0.8-1.5 cm wide; branches 0.5-2 cm long, spikelets congested, shortly pedicellate; pedicels to 0.5 mm long, oblong, subtended by a terete bristle; bristles 3-8 mm long, persistent, antrorsely barbed. Spikelets 2-2.5 mm long, ovate, apex obtuse, falling entire; rachilla internodes elongated between glumes; glumes unequal, same size as florets, thinner than fertile lemma; lower glumes about 1 mm long, 3-veined, oblate, membranous, apex obtuse; upper glumes 2-2.2 mm long, 11- to 13-veined, ovate, gibbous, membranous or coriaceous at maturity, margins involute (resembling auricles), apex obtuse; sterile lemmas 2-2.5 mm long, ovate, membranous or coriaceous at maturity, thicker on margins, sulcate, apex obtuse, paleas 1/4 the length of the lemma, hyaline; fertile lemmas 2–2.5 mm long, indurate, transversely rugose, margins involute, apex acute; palea indurate, rugose; anthers 0.8-1 mm long, purple. 2n = 18.

DISTRIBUTION AND HABITAT. Setariopsis auriculata occurs in moist, shady habitats and ranges from Arizona through Mexico and Central America to Colombia and Venezuela.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: southwestern Chihuahua, Aug 1885, E. Palmer 78 (US).

346. *Setariopsis latiglumis* (Vasey) Scribn., Publ. Field Colombian Mus. Bot. Ser. 1(3): 289–290, t. 11. 1896. *Setaria latiglumis* Vasey, Bull. Torrey Bot. Club 13(12): 229. 1886.

Caespitose annual. Culms (40)70-100 cm tall, erect; nodes papillous-hispid. Sheaths hispid, with papillose-based hairs; ligules 2-2.5 mm long, a fringe of hairs; blades 10-30 cm long, 5-9 mm wide, scaberulous and sparsely hairy, margins scabrous. Panicles 4–20 cm long, 1–2 cm wide, spiciform, linear or lanceolate, truncate or rounded at the ends, or tapering above; branches with spikelets congested, short pedicellate, subtended by a terete bristle, the bristles 7–10 mm long, persistent, antrorsely scaberulous. Spikelets 3-3.5 mm long, oblong or ovate, gibbous, falling entire; glumes unequal, oblate, gibbous, exceeding or reaching apex of florets, thinner than fertile lemmas; lower glumes 1-1.3 mm long, 2-veined, upper glumes 3-3.2 mm long, 17- to 19-veined, herbaceous or indurate, firmer above, apex entire to erose, obtuse to cuspidate; sterile lemmas 3-3.5 mm long, 9-veined, membranous or coriaceous at maturity, firmer above, emarginate, paleas 1/5 as long as the sterile lemma, pilose; fertile lemmas 2-3 mm long, 5-veined, finely rugulose to tuberculate over the surface, indurate, pallid, lightly keeled, margins involute, apex cuspidate; paleas almost as long as lemma, indurate, thinner on margins, surface tuberculate; anthers 3, 0.5-0.7 mm long. Caryopsis ovoid, with adherent pericarp. 2n = 18.

DISTRIBUTION AND HABITAT. Setariopsis latiglumis grows in tropical forests and thorny scrub. This species is endemic to Mexico, occurring in Chiapas, Chihuahua, Guanajuato, Guerrero, México, Michoacán, Morelos, Nayarit, and Puebla (Dávila et al., 2006).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: km 20 Cd. Cuauhtémoc de Cd. Chihuahua, Aug 1885, *E. Palmer 117A* (US). Sorahastrum Nash

Annual or perennial; caespitose, sometimes rhizomatous. Culms erect, nodding or clambering, unbranched; nodes densely pubescent, particularly in young plants. Leaves not aromatic; ligules membranous, glabrous or pubescent; blades flat, involute, or folded. Inflorescence a terminal, secund or equilateral panicle with evident rachises and numerous branches, not subtended by modified leaves; branches capillary, rebranching, with many rames; disarticulation in the rames, beneath the sessile spikelets. Spikelets sessile, subtending a hairy pedicel (2 pedicels in the terminal spikelet units), dorsally compressed; callus blunt or sharp; glumes coriaceous; lower glumes pubescent, 5- to 9-veined, acute; upper glumes slightly longer, usually glabrous, 5-veined, truncate; lower florets reduced to a hyaline lemma; upper florets bisexual, lemmas hyaline, bifid, awned from the sinuses; awns usually once- or twice-geniculate, often spirally twisted, shortly strigose, brownish; anthers 3; ovaries glabrous. Caryopsis flattened; pedicels slender, not fused to the rame axes; pedicellate spikelets absent. x = 10.

Sorghastrum includes about 21 species.

KEY TO SPECIES OF SORGHASTRUM

347. Sorghastrum nudipes Nash, N. Amer. Fl. 17(2): 129. 1912.

Caespitose perennial with elongated rhizomes; basal innovations extravaginal. Culms 55-120 cm tall, 1-2.5 mm thick, erect, glabrous. Sheaths smooth, glabrous; ligules 15-25 mm long, eciliate membrane; blades 10-30 cm long, 2-5 mm wide, flat, smooth, glabrous or pubescent, margins scabrous, apex acute. Panicles 8-22 cm long, open, lax, with only a few branches near the apex, the branches flexuous and long, the spikelets inserted at the end of the branches; rachis internodes filiform. Spikelets 5.5-7.5(9) mm long, lanceolate, hirsute, falling entire; bisexual spikelets with 1 basal sterile floret and 1 fertile; glumes equal, firmer than fertile lemma, as long as spikelet, oblong, chartaceous or coriaceous; lower glumes 7- to 9-veined, pubescent, apex truncate; upper glumes 5-veined, glabrous or pubescent, hairy below, apex acute; sterile lemmas 5-6.5 mm long, oblong, hyaline, 2-veined, ciliate on margins, apex 2-lobed, palea minute; fertile lemmas 3.5-5.3 mm long, oblong, hyaline, 3-veined, ciliolate on margins, apex 2-lobed, awned, the awn 12-18 mm long, straight or geniculate, with twisted column, column hirsute, palea absent or minute; anthers 3-4 mm long. Caryopsis 2-3 mm long.

DISTRIBUTION AND HABITAT. Sorghastrum nudipes is native to Mexico and is known from Chihuahua and Durango (Herrera Arrieta, 2014).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Batopilas: SW Chihuahua, Aug 1885, *E. Palmer 11* (US). Guachohi: 2 km al NE de Norogachic (Tucheachi), 24 Sep 1985, bosque de pino-encino [pine-oak forest], 2100 m, *Dávila*,

FIGURE 223

Perennial; with elongated, stout, and scaly rhizomes. Culms 50–230 cm tall, 1.5–4.5 mm thick below, erect, glabrous. Sheaths glabrous or sparsely hispid; ligules 2–5 mm long, eciliate membrane, auricles thick and pointed; blades 10–50 cm long, 1–4 mm wide, glabrous or pubescent, margins scabrous, apex attenuate. Panicles 10–35 cm long, open to loosely contracted, oblong, dense, yellowish to brownish, with numerous branches near the apex, these appearing dense and crowded, the spikelets numerous along the branches, the branches usually rebranched; rachis terete. Spikelets 5–8.7 mm long, lanceolate, falling entire; bisexual spikelets bearing 1 basal sterile floret and 1 fertile, callus bearded; glumes equal, 5–8 mm long, firmer than fertile lemma, as long as spikelet, oblong, coriaceous, light brown; lower glumes 7- to 9-veined, pubescent, apex truncate; upper glumes 5-veined, glabrous, apex acute; sterile lemmas 4–6 mm

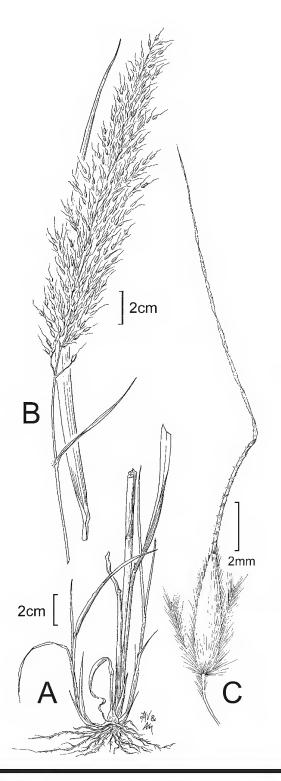

FIGURE 223. Sorghastrum nutans. A. Habit. B. Inflorescence. C. Sessile spikelet. Drawn by Linda Ann Vorobik and Annaliese Miller; copyright Utah State University.

long, oblong, hyaline, 2-veined, ciliate on margins, apex 2-lobed, palea minute; fertile lemmas 3.5-5.5 mm long, oblong, hyaline, 3-veined, ciliolate on margins, apex 2-lobed, awned, the awns 10-22 mm long, geniculate, with twisted column, column hirsute, palea absent or minute; anthers 3-5 mm long. Caryopsis 2.3 mm long. 2n = 20, 40, 80.

DISTRIBUTION AND HABITAT. Sorghastrum nutans grows in a wide range of habitats, from prairies to woodlands, savannahs, and scrubland vegetation. It is native in North America from Canada to Mexico, and South America in Brazil.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: La Campana, 24 Sep 76, Jardines de observación [observation gardens], 1500 m, S. González 767 (RELC). Sorghum Moench

Annual or perennial. Culms internodes solid. Leaves not aromatic, basal and cauline; auricles absent; ligules membranous and ciliate or of hairs; blades usually flat. Inflorescence a terminal, panicle with evident rachises; primary branches whorled, compound, the ultimate units rames; rames with most spikelets in heterogamous sessile-pedicellate spikelet pairs, terminal spikelet unit on each rame usually a triplet of 1 sessile and 2 pedicellate spikelets, rame axes without a translucent median line; disarticulation in the rames below the sessile spikelets, sometimes also below the pedicellate spikelets (cultivated taxa not or only tardily disarticulating); pedicels slender, neither appressed nor fused to the rame axes. Sessile spikelets dorsally compressed, calluses blunt or pointed; lower glumes dorsally compressed and rounded basally, 2-keeled or winged distally, 5- to 15-veined, usually unawned; upper glumes 2-keeled, sometimes awned; lower florets reduced to hyaline lemmas; upper florets pistillate or bisexual, lemmas hyaline, sometimes awned. Pedicellate spikelets staminate or sterile, well-developed, often subequal to the sessile spikelets in size. x = 10.

Most of the approximately 32 species of *Sorghum* are native to tropical and subtropical regions of the Eastern Hemisphere (Liu et al., 2014).

KEY TO SPECIES OF SORGHUM

- 1. Perennials with rhizomes; spikelets disarticulating at maturity; caryopsis not exposed at maturity S. halepense

349. Sorghum bicolor* (L.) Moench, Methodus 207. 1794.

FIGURE 224

Annual or short-lived perennial; often tillering, without rhizomes. Culms 50–500+ cm tall, 1–5 cm thick, sometimes branching above the base; nodes glabrous or appressed-pubescent; internodes glabrous. Ligules 1–4 mm long; blades 5–100 cm long, 5–100 mm wide, sometimes glabrous. Panicles 5–60 cm long, 3–30 cm wide, open or contracted, primary branches compound, terminating in rames with 2–7 spikelet pairs; disarticulation usually not occurring or tardy. Sessile spikelets 3–9 mm long, lanceolate to ovate, bisexual; calluses blunt; glumes coriaceous to membranous, glabrous, densely hirsute, or pubescent, keels usually winged; upper lemmas unawned or with a geniculate, twisted awn, the awn 5–30 mm long; anthers 2–2.8 mm long. Pedicellate spikelets 3–6 mm long, usually shorter than the sessile spikelets, staminate or sterile; pedicels 1–2.6 mm long. Caryopsis usually exposed at maturity. 2*n* = 20, 40.

DISTRIBUTION AND HABITAT. Sorghum bicolor was domesticated in Africa 3,000 years ago, reaching northwestern India before 2500 BCE (Before the Common Era), and became an important crop in China after the Mongolian conquest. It was introduced to the Western Hemisphere in the early sixteenth century and is now an important crop in the United States and Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Práxedis G. Guerrero: Rancho Escuela, km 65 carr. [hwy] Juárez–Porvenir, 16 Aug 1997, cultivo de sorgo [cultivated Sorghum], 1400 m, I. Enríquez, S. Ordoñez, L. Sushii, A. Perales & N. Loyola IEA12 (UACJ).

350. *Sorghum halepense** (L.) Pers., Syn. Pl. 1: 101. 1805. *Holcus halepensis* L., Sp. Pl. 2: 1047–1048. 1753.

FIGURE 225

Perennial; rhizomatous. Culms 50–200 cm tall, 0.4–2 cm thick; nodes appressed-pubescent; internodes glabrous. Ligules 2–6 mm long, membranous, conspicuously ciliate; blades 10–90 cm long, 8–40 mm wide. Panicles 10–50 cm long, 5–25 cm wide, primary branches compound, terminating in rames of 1–5 spikelet pairs; disarticulation usually beneath the sessile spikelets, sometimes also beneath the pedicellate spikelets. Sessile spikelets 3.8–6.5 mm long, 1.5–2.3 mm wide, bisexual; calluses blunt; glumes indurate, shiny, appressed-pubescent; upper lemmas unawned, or with a geniculate, twisted awn, the awn to 13 mm long; anthers 1.9–2.7 mm long. Pedicellate spikelets 3.6–5.6 mm long; glumes membranous to coriaceous, unawned, staminate;

pedicels 1.8-2.7 mm long. Caryopsis not exposed at maturity. 2n = 20, 40, and several dysploid counts also reported.

DISTRIBUTION AND HABITAT. Sorghum halepense is native to the Mediterranean region. It is sometimes grown for forage in North America, but it is considered a serious weed in warmer parts. It hybridizes readily with *S. bicolor* and derivatives of such hybrids are widespread.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: aprox. 7 km al N del poblado [village] de Samalayuca, a los lados [sides] de la carr. [hwy], 30 Jul 1994, 1200 m, R. Corral, E. Pérez, A. Sphenopholis Scribn.

Plants usually perennial, rarely winter annual; usually caespitose. Culms sometimes solitary, leaves evenly distributed. Sheaths open; auricles absent; ligules membranous, erose; blades flat or involute, glabrous or pubescent. Inflorescence a panicle,

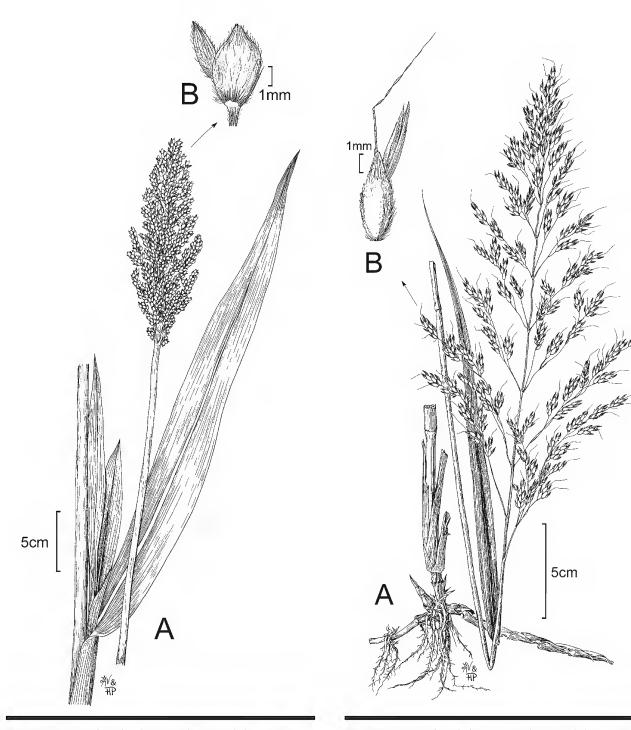

FIGURE 224. Sorghum bicolor. A. Habit. B. Spikelet pair. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

FIGURE 225. Sorghum halpense. A. Habit. B. Spikelet pair. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

open or contracted, nodding to erect; disarticulation below the glumes, the distal floret sometimes disarticulating first. Spikelets pedicellate laterally compressed, with 2-3 florets; rachillas glabrous or pubescent, prolonged beyond the base of the distal floret as a slender bristle; glumes almost equaling the lowest floret, dissimilar in width, membranous to subcoriaceous, margins scarious, apex unawned; lower glumes narrower than the upper glumes, 1(3)-veined, strongly keeled, apex acute; upper glumes elliptical to oblanceolate, obovate, or subcucullate, 3(5)-veined, strongly to slightly keeled, apex acuminate, acute, rounded, or truncate; calluses glabrous; lemmas herbaceous, not indurate, rounded on the lower back, smooth or partly or wholly scabrous, usually keeled near the apex, 3(5)-veined, veins usually not visible, unawned or awned from just below the apex, awns straight or geniculate; paleas hyaline, shorter than the lemmas; lodicules 2, free, membranous, glabrous, toothed or entire; anthers 3; ovaries glabrous. Caryopsis shorter than the lemmas, concealed at maturity, linear-ellipsoid, glabrous; endosperm liquid. x = 7.

Sphenopholis includes five species and is most diverse in the southeastern United States (Finot et al., 2004). One species, Sphenopholis obtusata, extends outside the United States to southern Mexico and the Caribbean.

351. Sphenopholis obtusata (Michx.) Scribn., Rhodora 8(92): 144. 1906. Aira obtusata Michx. Fl. Bor.-Amer. 1: 62. 1803.

FIGURE 226

Culms (9)20–130 cm tall. Sheaths glabrous or hairy, sometimes scaberulous; ligules (1)1.5–2.5 mm long, erose-ciliate, more or less lacerate; blades 5–14 cm long, (1)2–8 mm wide, usually flat, rarely slightly involute, scabrous or pubescent. Panicles (2)5–15(25) cm long, 0.5–2 cm wide, usually erect, often spikelike, spikelets usually densely arranged. Spikelets 2.2–3.6 mm long; lower glumes less than $\frac{1}{3}$ as wide as the upper glumes; upper glumes 1.5–2.5 mm long, subcucullate, width:length ratio 0.3–0.5, apex rounded to truncate; lowest lemmas 1.9–2.8 mm long, usually scaberulous distally; distal lemmas usually smooth on the sides, occasionally scabrous, unawned; anthers 0.2–1 mm long. 2n = 14.

DISTRIBUTION AND HABITAT. Sphenopholis obtusata grows in prairies, marshes, dunes, forests, and waste places up to 2,500 m. Its range extends from British Columbia to New Brunswick, through most of the United States to southern Mexico and the Caribbean (Finot et al., 2004). This species has been reported from Chihuahua (Espejo Serna et al., 2000).

FIGURE 226. Sphenopholis obtusata. A. habit. B. Glumes. C. Lower floret. D. Upper floret. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

Sporobolus R. Br.

Annual or perennial; sometimes rhizomatous, rarely stoloniferous. Culms 10-250 cm tall, erect, rarely mat-forming, caespitose (often forming large clumps), glabrous. Sheaths longer or shorter than the internodes usually with smooth margins, occasionally ciliate; ligule ciliate, a line of hairs; blades 3–70 cm long, 1–15 mm wide at base, filiform or linear, flat, involute, or terete, not pungent, cauline without auricles. Inflorescence 0.5-80 cm long, 0.3-30 cm wide, a panicle or spikes (multiple branches) that bear 2 rows on 2 sides of a somehat flattened, triangular rachis (that superficially appears to be 1-sided or pectinate); exserted or partially included in upper sheath; rachis smooth; primary branches appressed, spreading, divaricate, or reflexed from the main axis, solitary or loosely whorled, sometimes with capillary branches terminating in a spikelet; secondary branches appressed or spreading; pedicels erect, rarely secund, glabrous, scaberulous or scabrous; cleistogamous spikelets occassionally present, in axillary inflorescences. Spikelets 1–4(7) mm long, solitary, laterally or dorsally compressed, sometimes terete; disarticulation usually above the glumes, commonly above the upper glume, occasionally below with the lemma and palea falling as a unit; glumes shorter or longer than the florets, very unequal, smooth, glabrous; lower glume without midvien or 1-veined; upper glume about the same length as the lemma, usually awnless, 1-veined; florets 1 per spikelet; lemma entire, awnless, glabrous or hairy, pubescent to pilose, 1-veined, rarely 3-veined, membranous with glabrous veins; palea glabrous, smooth, membranous, margins not enfolding the fruit, 2-veined, often splitting as grain matures; lodicules 2 or sometimes absent, truncate; stamens 2 or 3; anthers yellow, reddish-purple, or olivaceous-plumbeous; stigmas 2. Modified caryopsis a follicoid fruit with a free pericarp, commonly swelling and mucilaginous when wet; hilum punctiform; embryo with an epiblast, scutellar tail, and elongated mesocotyl internode, endosperm hard. x = 9, 10.

Sporobolus is a cosmopolitan genus of nearly 200 species that grow in tropical, subtropical, and warm-temperate regions throughout the world (Peterson et al., 2003, 2004, 2014b). Eleven species are present in Chihuahua. The genus as currently circumscribed includes all species formerly placed in Spartina Schreb., Crypsis Aiton, and Calamovilfa (A. Gray) Hack. ex Scribn. & Southw. (Peterson et al., 2014b).

KEY TO SPECIES OF SPOROBOLUS

RET TO SPECIES OF SPOROBOLUS
1. Inforescence composed of 3–25 spikes, each spike 5–15 cm long bearing sessile spikelets on 2 rows on 2 sides of a somehat flattened, triangular rachis (that superficially appears to be 1-sided or pectinate)
1. Inflorescence a true panicle with branches that rebranch and the spikelets pedicellate.
2. Annuals; culms 10–40 cm tall
2. Perennials; culms 30–250 cm tall.
3. Sheaths and collar with a conspicuous tuft of white hairs.
4. Panicles contracted, spikelike; branches appressed.
5. Culms 35–100(120) cm tall, 2–4 mm diameter near the base
5. Culms 100–200 cm tall, (3)4–10 mm diameter near the base
4. Panicles open, branches spreading at least from the middle of the rachis to the apex, the base sometimes included.
6. Panicles usually exserted, branches divaricate and flexuous, usually tangled with each other; lower glumes
0.9–1.5 mm long <i>S. flexuosus</i>
6. Panicles usually included at the base, branches erect, not markedly flexuous and not tangled; lower glumes
0.6–1.1 mm long S. cryptandrus
3. Sheaths and collar glabrous.
7. Panicles 0.3–3 cm wide, spikelike, the branches appressed to the main axis.
8. Panicles 9–15(20) cm long, 3–5(10) mm wide, whitish; culms tufted; glumes unequal, more than 3/3 as long as
the floret
8. Panicles 20–35(50) cm long, 3–22(3) mm wide, stramineous; culms weakly tufted; glumes about equal, less than
3 as long as the floret
7. Panicles 3-25 cm wide (sometimes only 0.3 cm wide in immature S. pyramidatus), open, the branches widely
spreading at least from the middle of the rachis to the apex.
9. Panicle branches capillary, the proximal ones solitary; pedicels capillary, 2.5-3(4) mm long, flexuous; upper
glumes 0.7–1 mm long
9. Panicle branches not capillary, the proximal ones whorled; pedicels not capillary, 0.3–3 mm long, spreading or appressed; upper glumes (0.8)1.4–2.5 mm long.
10. Panicle branches widely divaricate and flexuous, usually tangled with each other
10. Panicle branches widely open or erect, not tangled.

- 11. Culms 30–100(120) cm tall, robust perennials, often forming large tough leafy tussocks; leaf blades cauline; sheaths usually bearded with long hairs on the margins and summit.

352. Sporobolus airoides (Torr.) Torr. subsp. airoides, Pacific Railr. Rep. Parke, Bot. 7: 21. 1856.

FIGURE 227

Densely caespitose perennial. Culms 35–120 (150) cm tall, erect, stout, glabrous below the nodes; base diameter 1-2(3.5) mm wide, rounded; internodes glabrous. Sheaths 3/3 to about as long as the internodes above, glabrous, shinny, sometimes with a few long hairs near the summit, these hairs up to 6 mm long; ligules 0.1–0.3 mm; blades (3)10–45(60) cm long, (1)2–5(6) mm wide, flat to involute, glabrous below and scaberulous to scabrous above; margins mostly smooth to scaberulous. Panicles (10)15-45 cm long, 15-25 cm wide, open, diffuse, subpyramidal, often included in the uppermost sheath; branches 1.5-13 cm long, ascending to widely spreading 30°-90° from culm axis; secondary branches mostly spreading and not floriferous on lower 1/4 to 1/3; pulvini in axils of primary branches glabrous; pedicels 0.5-2 mm long, spreading, glabrous to scabrous. Spikelets 1.3-2.8 mm long, spreading, purplish or greenish; glumes 0.5-2.4(2.8) mm long, lanceolate to ovate, membranous, unequal; lower glume 0.5-1.8 mm long, often appearing without a midvein, the apex acute; upper glume 1.1-2.4(2.8) mm long, apex acute to obtuse; lemmas 1.2-2.5 mm long, ovate, membranous, glabrous, the apex acute; paleas 1.1-2.4 mm long, ovate, membranous, glabrous, the apex acute to obtuse; stamens 3; anthers 1.1-1.8 mm long, yellowish to purplish. Modified caryopses 1–1.4 mm long, ellipsoid, reddish-brown, striate, 2n = 80, 90, 108, 126.

DISTRIBUTION AND HABITAT. Sporobolus airoides occurs throughout the arid portions of northwestern North America and in Mexico south to Puebla. It is common in dry to sandy gravelly flats or slopes usually associated with alkaline soils, occurring with Atriplex canescens, Larrea tridentata, and Distichlis spicata. In northern Mexico, S. airoides is a halophytic species forming the alkali zacaton grasslands where the edaphic effects of a diverse combination of chloride carbonates and sulfates accumulates to form very saline conditions. Sporobolus airoides subsp. regis (I. M. Johnst.) Wipff & S.D.Jones, known only from Coahuila, differs from the typical subspecies in having elongate rhizomes, pilose sheaths on the lower surface, and panicle branches with a tuft of hairs in the lower axils (Peterson et al., 2004).

353. Sporobolus alterniflorus (Loisel.) P. M. Peterson & Saarela. Taxon 63(6): 1236. 2014. Spartina alterniflora Loisel., Fl. Gall. 719. 1807.

FIGURE 228

Plants perennial rhizomatous; rhizomes elongate, flaccid, white, scales inflated, not or only slightly imbricate. Culms to 250 cm tall, (0.3)5-15(20) mm thick, erect, solitary or in small clumps, succulent, glabrous, having an unpleasant, sulphurous odor when fresh. Sheaths mostly glabrous, throat glabrous or minutely pilose, lower sheaths often wrinkled; ligules 1–2 mm; blades to 60 cm long, 3-25 mm wide, lower blades shorter than those above, usually flat basally, becoming involute distally, abaxial surfaces glabrous, adaxial surfaces glabrous or sparsely pilose, margins usually smooth, sometimes slightly scabrous, apex attenuate. Panicles 10-40 cm long, with 3-25 spikelike branches, often partially enclosed in the uppermost sheath; spikes 5–15 cm long, loosely appressed, not twisted, more or less equally subremote to moderately imbricate throughout the panicle, axes often prolonged beyond the distal spikelets, with 10-30 sessile spikelets. Spikelets 8-14 mm long, straight, usually divergent, more or less equally imbricate on all the branches; glumes straight, sides usually glabrous, sometimes pilose near the base or appressedpubescent, hairs to 0.3 mm long; lower glumes 4-10 mm long, acute; upper glumes 8-14 mm long, keels glabrous, lateral veins not present, apex acuminate to obtuse, occasionally apiculate; lemmas glabrous or sparsely pilose, apex usually acuminate; paleas slightly exceeding the lemmas, thin, papery, apex obtuse or rounded; anthers 3–6 mm long. 2n = 62

DISTRIBUTION AND HABITAT. Sporobolus alterniflorus is found on muddy banks, usually along margins of saline lakes or marshes, more commonly along the coast in eastern North and South America (Mobberley, 1956). This species has been cited for Chihuhua in Espejo Serna et al. (2000).

354. Sporobolus contractus Hitchc., Amer. J. Bot. 2: 303. 1915. FIGURE 229

Caespitose perennial. Culms 35-100(120) cm tall, erect, glabrous below the nodes, rounded near base, internodes glabrous; base diameter 2-4(5) mm long. Sheaths ¾ to longer than the internodes above, glabrous; margins with ciliate hairs especially on the upper portions, these hairs up to 3 mm long forming a conspicuous tuft near the summit; ligules 0.4-1 mm long; blades (2)4–35 cm long, 3–8 mm wide, flat to involute, glabrous below and above; margins whitish, somewhat scaberulous. Panicles (10)15–45(50) cm long, 0.2–0.8(1) cm wide, narrow, tightly contracted, dense and spikelike, usually included in the uppermost sheath; primary branches 0.3–1.5 cm long, appressed; secondary branches appressed and floriferous to base; pulvini in axils of primary branches glabrous; pedicels 0.2-2 mm long, appressed, scaberulous. Spikelets 1.7-3.2 mm long, whitish to plumbeous; glumes 0.7-3.2 mm long, narrow lanceolate, membranous, unequal, prominently keeled, scaberulous along the keel; lower glumes 0.7-1.7 mm long, rarely without a midvein, the apex acute to acuminate; upper glumes 2–3.2 mm long, the apex acute; lemmas 2-3.2 mm long, linear membranous, glabrous, the apex acute; paleas 1.8-3 mm long, linear-lanceolate, membranous, glabrous, the apex acute; stamens 3; anthers 0.3-0.5 mm long, light vellowish. Modified carvopses 0.8-1.2 mm long, ellipsoid, laterally flattened, light brownish or translucent. 2n = 36.

DISTRIBUTION AND HABITAT. In Mexico, *S. contractus* ranges from Baja California, Chihuahua, and Sonora to Coahuila and Nuevo León on dry to moist sandy soils, occasionally in salt-desert scrub associated with *Atriplex confertifolia*, *A. canescens, Artemisia tridentata* Nutt. and in desert grasslands with pinyon–juniper woodlands at elevations of 300–2,300 m.

359. Sporobolus pyramidatus (Lam.) Hitchc., Man. Grasses W. Ind. 84. 1936.

FIGURE 234

Caespitose annual with intravaginal branching at base. Culms 7-35(60) cm tall, erect or decumbent, base rounded, glabrous below the nodes, internodes glabrous; base diameter 1–1.6 mm wide. Sheaths 1/2 to almost as long as the internodes above, glabrous or with ciliate hairs on the margins and summit, the hairs up to 3 mm long; ligules 0.3–1 mm long; blades 2–12(20) cm long, 2-6 mm wide, flat, glabrous below and scaberulous above, sometimes with a few hirsute hairs, mostly borne near base; margins ciliate-pectinate. Panicles 4-15(18) cm long, 0.3-6 cm wide, open and pyramidal with verticillate branches spreading 30°-90°, contracted and narrow when immature; primary branches 0.5-4.5 cm long, not floriferous on the lower 1/3-1/2, lowest branches whorled in verticels of 7–12(15), lower portions of each branch with elongated glands; secondary branches appressed; pedicels 0.1-0.5 mm long, appressed. Spikelets 1.2-1.8 mm long, plumbeous or brownish, often secund along the branch; glumes 0.3–1.8 mm long, ovate to obovate, membranous, unequal; lower glumes 0.3-0.7 mm long, without a midvein, the apex acuminate, obtuse or irregularly truncate; upper glumes 1.2-1.8 mm long, the apex acute or acuminate and sometimes scaberulous; paleas 1.1-1.6 mm long, ovate to elliptic, membranous, the apex acute to obtuse; stamens 3; anthers 0.2-0.4 mm long, yellow or purplish. Modified caryopsis 0.6–1 mm long, obovoid, faintly striate, light brownish. 2n = 24, 36, 54.

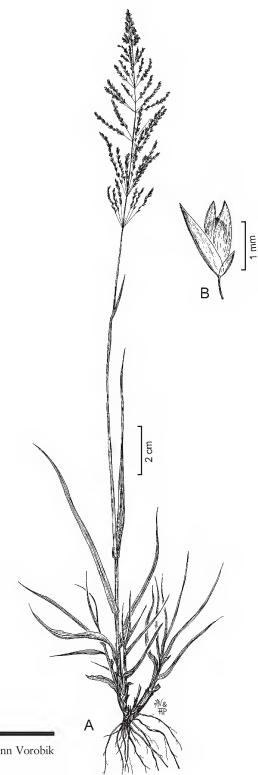

FIGURE 234. Sporobolous pyramidatus. A. Habit. B. Spikelet. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

DISTRIBUTION AND HABITAT. Sporobolus pyramidatus is common throughout Mexico, occurring on disturbed soils, roadsides and railways, coastal sands, and alluvial slopes in many plant communities at 5–1,750 m.

360. Sporobolus spiciformis Swallen, Proc. Biol. Soc. Wash. 56: 78, 1943.

FIGURE 235

Caespitose perennial. Culms 30–70 cm tall, erect, mostly glabrous; base diameter 1–1.8 mm wide. Sheaths shorter than the internodes, rounded, striate, scaberulous, hairy only at the corners; ligules 0.8–1 mm long, densely ciliate; blades 7–20 cm

FIGURE 235. Sporobolus spiciformis. A. Habit. B. Inflorescence. C. Spikelet. Drawn by Cathy Pasquale for Smithsonian Institution, Department of Botany.

long, 1.5–2 mm wide at the base, flat or becoming involute or at least boat shaped in section, firm, flexuous, adaxial surface with white ridges. Panicles 9–17 cm long, 3–5(10) mm wide, spiciform and spikelike, white, often the lower portion included in the sheath. Spikelets 1.6–2.3 mm long; glumes 0.8–1.8 mm long, unequal, hyaline, the apex obtuse to acute, minutely erose; lower glumes 0.8–1.2 mm long; upper glumes 1–1.8 mm long,

1-veined; lemmas 1.6–2.3 mm long, the apex obtuse to acute, minutely erose; paleas 1.6–2.3 mm long, the apex minutely 2-toothed; anthers 1–1.3 mm long, yellow. Modified caryopses 0.8-1 mm long, ellipsoid. 2n = 40.

DISTRIBUTION AND HABITAT. Sporobolus spiciformis is endemic to the Chihuahuan Desert Region, reported from Chihuahua, Coahuila, and Nuevo León, where it is restricted to saline or gypsum-derived soils associated with Yucca, Ephedra, Nama, Suaeda, Chilopsis linearis, and Prosopis; at 410–1,750 m.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Jiménez: Reserva de la Biosfera de Mapimí, 1 km de Las Palomas, 6 Jul 1997, matorral xerófilo [xerophilous scrub], 1055 m, *A. García* 2638 (CIIDIR, MEXU).

361. Sporobolus trichodes Hitchc., Contr. U.S. Natl. Herb. 17(3): 311. 1913.

Perennial; caespitose. Culms erect; slender; 20-60 cm long; wiry. Leaves mostly basal; sheaths persistent and investing base of culm with fibrous dead sheaths; ligules 3-5 mm long, fringe of hairs, pilose-membranose; blades 5-10 cm long, 1-2 mm wide, involute. Panicle 5-10 cm long, 5-10 cm wide, open, ovate, effuse; branches capillary, spreading. Spikelets 2.5–3(4) mm long, solitary, bisexual; pedicels filiform, flexuous, with 1 fertile floret; florets 1.5-2 mm long, lanceolate, subterete, purple or brown; disarticulating below each fertile floret; glumes shorter than spikelet, ½ as long as the adjacent fertile lemma, membranous, deciduous; lower glumes 0.6-0.7 mm long, lanceolate, without keels, 1-veined, apex acute; upper glume 0.7-1 mm long, ovate, without keels, 1-veined, apex acute; fertile lemmas 1.5-2 mm long, ovate, membranous, light brown or purple, without keels, 1-veined, apex acute; palea similar to lemma, 2-veined, keels approximate; stamens 3; anthers 1-1.1 mm long, purplish. Modified caryopses about 1 mm long.

DISTRIBUTION AND HABITAT. Sporobolus trichodes is a Mexican endemic widely distributed in Aguascalientes, Chihuahua, Guanajuato, Guerrero, Jalisco, México, Michoacán, Morelos, Veracruz, and Zacatecas.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 24.2 km W of Balleza on Mex 127 towards Guachochi, 13 Sep 1989, pine forest, 2380 m, *P.M. Peterson, Annable & Y. 362. Sporobolus wrightii Munro ex Scribn., Bull. Torrey Bot. Club 9: 103, 1882.

FIGURE 236

Densely caespitose perennial. Culms 90–250 cm tall, erect, stout, glabrous below the nodes, base rounded, internodes glabrous; base diameter 2–9 mm wide. Sheaths 3/3 to a little longer than the internodes above, glabrous, shinny, rarely with a few

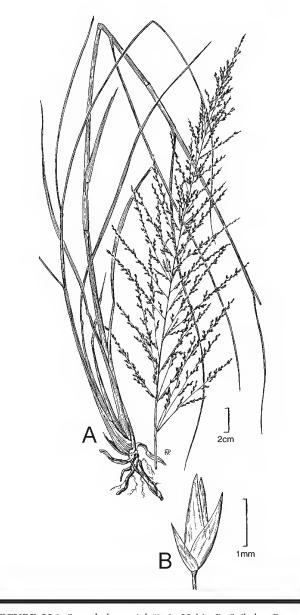

FIGURE 236. Sporobolus wrightii. A. Habit. B. Spikelet. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

long hairs near the summit, these hairs up to 6 mm long; ligules 1–2 mm long; blades 20–70 cm long, 3–10 mm wide, flat rarely involute, glabrous below and scabrous above; margins scabrous roughened. Panicles 20–60 cm long, 12–26 cm wide, open, broadly lanceolate, exserted; primary branches 1.5–10 cm long, ascending to widely spreading 20°–70° from the culm axis; secondary branches appressed and floriferous to base; pulvini in axils of primary branches glabrous; pedicels mostly 0.2–0.5 mm

long, appressed. Spikelets 1.5–2.5 mm long, crowded and appressed, purplish or greenish; glumes 0.5–2 mm long, lanceolate to ovate, membranous, unequal; lower glumes 0.5–1 mm long, often appearing without a midvein, the apex acute; upper glumes 0.8–2 mm long, the apex acute to obtuse; lemmas 1.2–2.5 mm long, ovate, membranous, glabrous, the apex acute to obtuse; paleas 1.1–2.5 mm long, ovate, membranous, glabrous, the apex acute to obtuse; stamens 3; anthers 1.1–1.3 mm long, yellowish to purplish. Modified caryopses 1–1.4 mm long, ellipsoid, reddish-brown or blackish, striate. 2n = 36.

DISTRIBUTION AND HABITAT. Sporobolus wrightii grows in moist clay flats and rocky slopes near saline habitats associated with *Atriplex*, *Acacia*, *Suaeda*, *Prosopis*, and *Opuntia* at elevations of 5–1,800 m.

Stenotaphrum Trin.

Annual or perennial; sometimes rhizomatous or stoloniferous. Culms usually compressed; internodes solid. Leaves cauline; sheaths shorter than the internodes, compressed; ligules membranous and ciliate or of hairs; blades flat or folded. Inflorescences spikelike panicles; branches very short, with fewer than 10 spikelets, appressed to and partially embedded in the flattened, corky rachises; disarticulation below the glumes, often with a segment of the branch. Spikelets lanceolate to ovate, unawned, lower glumes oriented away from the branch axes; glumes membranous; lower glumes scalelike, usually without veins; upper glumes 5- to 7-veined; lower florets staminate or sterile, lemmas 3- to 9-veined; upper florets bisexual; upper lemmas longer than the glumes, papery to subcoriaceous, 3- to 5-veined; upper paleas generally indurate, 2-veined; anthers 3. Caryopsis lanceolate to ovate, often failing to develop. x = 9.

Stenotaphrum is a genus of seven species that usually grow on the seashore or near the coast, primarily along the rim of the Indian Ocean. Three species are endemic to Madagascar, and *S. secundatum*, although thought to be introduced to Mexico, is probably native to the southeastern United States (Sauer 1972).

363. Stenotaphrum secundatum* (Walter) Kuntze, Revis. Gen. Pl. 2: 794. 1891.

Plants stoloniferous. Culms 10–30 cm tall, decumbent, rooting at the lower nodes, branched above the base, with prominent prophylls. Sheaths sparsely pilose, constricted at the summit; ligules about 0.5 mm long, membranous, ciliate; blades 3–15(18) cm long, 4–10 mm wide, thick, flat, glabrous, apex blunt. Panicles 4.5–10 cm long, less than 1 cm wide; rachises flattened, winged; branches 12–20, with 1–5 spikelets. Spikelets 3.5–5 mm long, partially embedded on 1 side of the branch axes; lower glumes about 1 mm long, rounded, irregularly toothed; upper glumes and lower lemmas 3–4 mm, about equal; upper lemmas papery, 5-veined, margins weakly clasping the paleas; anthers 2–2.5 mm long, tan or purple. Caryopsis about 2 mm long, oblong to obovate. 2*n* = 18.

DISTRIBUTION AND HABITAT. Stenotaphrum secundatum grows at the edges of swamps and lagoons and along inland streams and lakes. It is known from Aguascalientes, Chiapas, Chihuahua, Jalisco, Morelos, Puebla, Quintana Roo, and Tabasco. This species has been reported from Chihuahua (Espejo Serna et al., 2000).

Thinopyrum Á. Löve

Perennial; caespitose or not, sometimes rhizomatous. Culms usually erect. Sheaths glabrous or ciliate; auricles present or absent; ligules membranous; blades convolute or flat. Inflorescences terminal, distichous spikes, usually not disarticulating at maturity; disarticulation usually beneath the florets and tardy, occasionally in the rachises. Spikelets 1–3 times the length of the middle internodes, solitary, appressed to ascending, often arching outward at maturity; glumes oblong to lanceolate, stiff and thick, indurate to coriaceous, glabrous or with hairs, keeled or rounded at the base, usually more strongly keeled distally than below, margins often with a hyaline margin, apex truncate to acute, sometimes mucronate, unawned, without lateral teeth; lemmas 5-veined, stiff, thick and coriaceous, glabrous or

with hairs, truncate, obtuse, or acute, sometimes mucronate or awned, awns to 3 cm; anthers 3. x = 7.

Thinopyrum includes seven species, most of which are alkaline tolerant. It is native from the Mediterranean region to western Asia.

364. *Thinopyrum intermedium** (Host) Barkworth & D. R. Dewey, Amer. J. Bot. 72(5): 772. 1985.

Agropyron barbulatum Schur., Verh. Mitth. Siebenburg. Vereins Naturwiss. Hermannstadt 4: 91. 1853.

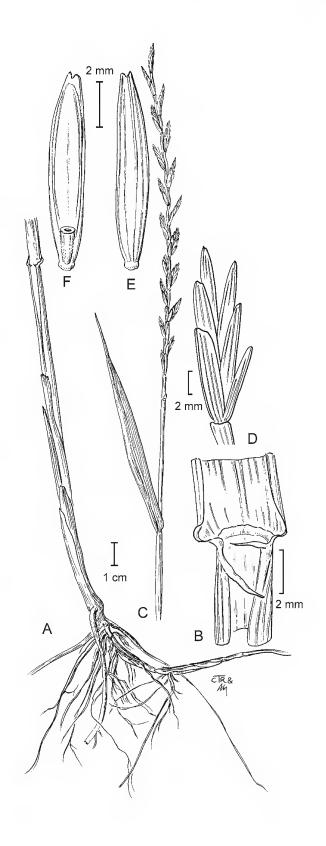

FIGURE 237

Plants rhizomatous, often glaucous. Culms 52–115 cm tall, glabrous or hairy, sometimes hairy only on the nodes, lowest internode plus sheath about 3 mm thick. Sheaths mostly glabrous, often ciliate on the margins; auricles 0.5-1.3 mm long; ligules 0.1-0.8 mm long; blades 2-8 mm wide, flat, abaxial surfaces glabrous, adaxial surfaces usually sparsely strigose, sometimes also with shorter pubescence, margins whitish, thicker than the veins. Spikes 8-21 cm long, erect or lax; middle internodes 7-12 mm long; rachises pubescent, not disarticulating at maturity. Spikelets 11-18 mm long, with 3-10 florets; glumes oblong, weakly keeled distally, glabrous and mostly smooth or strigose with 1–1.5 mm long hairs, hairs usually evenly distributed, keels scabrous, at least distally, midvein usually more prominent and longer than the lateral veins, margins not hyaline or hyaline near the apex, apex obliquely truncate or obtuse to acute, sometimes mucronate; lower glumes 4.5-7.5 mm long, 1.5-2.5 mm wide, 5- or 6-veined; upper glumes 5.5-8 mm long, 2-3 mm wide, 5- to 7-veined; lowest lemmas 7.5-10 mm long, glabrous or with 1-1.5 mm long hairs, hairs usually evenly distributed, sometimes only on the outer portion of the lemmas, apex occasionally awned, the awns to 5 mm long; paleas 7-9.5 mm long, keels usually ciliate on upper $\frac{1}{2}$; anthers 5–7 mm long, 2n = 42, 43.

DISTRIBUTION AND HABITAT. Thinopyrum intermedium is native to Europe and western Asia. It is one of the most common species of the genus and is widely introduced in western North America for erosion control, revegetation, forage, and hay. One of its advantages for erosion control and revegetation is that it establishes itself rapidly in many different habitats.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: La Campana, 24 Sep 76, Jardines de Observación Forrajera [forage observation garden], 1500 m, S. Gonzalez 771 (RELC). Práxedis G. Trachypogon Nees

Annual or perennial; caespitose or short rhizomatous. Culms unbranched; internodes semi-solid. Leaves cauline, not aromatic; sheaths shorter than the internodes, rounded; ligules membranous; blades flat to involute. Inflorescences terminal, solitary racemes of heterogamous subsessile-pedicellate spikelet pairs (rarely of 2 digitate spikelike branches), axes slender, without a translucent median groove; disarticulation beneath the pedicellate spikelets. Subsessile spikelets staminate or sterile, without a callus and unawned, otherwise similar to the pedicellate spikelets. Pedicels slender, not fused to the rames axes. Pedicellate spikelets bisexual; calluses sharp, strigose; glumes firm, enclosing the florets; lower glumes several-veined, encircling the upper glumes; upper glumes 3-veined; lower florets sterile; upper florets bisexual, lemmas firm but hyaline at the base, tapering to an awn; awns twisted, pubescent to plumose; paleas absent; anthers 3. x = 10.

Trachypogon is a tropical or warm-temperate genus of four species that is native to Africa and tropical to subtropical America.

365. *Trachypogon spicatus* (L. f.) Kuntze, Revis. Gen. Pl. 2: 794. 1891. *Stipa spicata* L. f., Suppl. Pl. 111. 1781.

Trachypogon secundus (J. Presl) Scribn.

Trachypogon plumosus (Humb. & Bonpl. ex Willd.) Nees.

Perennial. Culms 60–120 cm long, erect; nodes appressed-hirsute. Sheaths sparsely appressed-pilose; ligules 2–5 mm long, stiff, acute; blades usually 12–35 cm long, 3–8 mm wide, with a broad midrib. Racemes 10–18 cm long, the internodes glabrous. Pedicellate spikelets 6–8 mm long; glumes pilose; awns 4–6 cm long, pilose below, the hairs 1–2 mm long, nearly glabrous distally; anthers 4–5 mm long, orange. 2n = 20.

DISTRIBUTION AND HABITAT. *Trachypogon spi-catus* is found in sandy prairies, woodlands, rocky hills, and canyons in well-drained soils.

Tragus Haller

Annual or perennial; caespitose. Culms herbaceous, usually rooting at the lower nodes; nodes and internodes glabrous. Leaves cauline; sheaths open, usually shorter than the internodes, mostly glabrous but long-ciliate at the edges of the collar; ligules membranous, truncate, ciliate; blades usually flat, margins ciliate. Inflorescences terminal, exceeding the upper leaves, narrow, cylindrical panicles; branches resembling burs, with 2-5 spikelets; disarticulation at the base of the branches. Spikelets crowded, attached individually to the branches, with 1 floret; proximal spikelet(s) bisexual, larger than the distal spikelet(s); terminal spikelets often sterile; glumes unequal; lower glumes absent or minute, veinless, membranous; upper glumes usually exceeding the florets, 5- to 7-veined, with 5-7 longitudinal rows of straight or uncinate spine-like projections; lemmas 3-veined; paleas 2-veined, hyaline, membranous. x = 10.

Tragus has seven species, all of which are native to the tropics and subtropics of the Eastern Hemisphere; one is introduced into Chihuahua (Peterson et al., 2016).

366. Tragus berteronianus* Schult., Mant. 2: 205. 1824.

Annual. Culms (2)3.5–45 cm tall. Ligules 0.5–1 mm long; blades (0.5)0.7–8.5 cm long, 1.2–5 mm wide, glabrous. Panicles (1)2–13 cm long, (3)4–8 mm wide; rachises pubescent; branches (0.5)0.7–2.7 mm long, pubescent, with 2(3) spikelets, axes occasionally extending past the distal spikelets; proximal internodes 0.2–0.6(0.7) mm long, shorter than the second internodes. Lower spikelets (1.8)2–4.3 mm long; upper spikelets (0.8)1–3.9 mm long, sometimes sterile; lower glumes 0.1–0.6 mm long,

membranous, minutely pubescent; upper glumes 1.8-4.3 mm long, minutely pubescent, 5-veined, rarely with 1-2 additional veins adjacent to the midvein; glume projections (4)6-14, in 5 rows, (0.2)0.3-1 mm long, uncinate; lemmas (1.5)1.8-3.1 mm long, sparsely pubescent on the back, midveins occasionally excurrent, the mucros to 0.6 mm long; paleas (1.3)1.5-2.4 mm long; anthers 3, 0.4-0.6 mm long, yellow, occasionally purple or green-tinged. Caryopsis (0.9)1.2-2 mm long, 0.4-0.8 mm wide. 2n = 20.

DISTRIBUTION AND HABITAT. Tragus berteronianus is native to Africa and Asia and is now established in Arizona, New Mexico, and Texas to Mexico and Central and South America.

Tridens Roem. & Schult.

Perennial; usually caespitose, often with short, knotty rhizomes, occasionally with elongate rhizomes, never stoloniferous. Culms erect, mostly glabrous, lower nodes sometimes with hairs. Sheaths shorter than the internodes, open; ligules membranous and ciliate or of hairs; blades flat or involute, margins not thick and cartilaginous. Inflorescences terminal, usually panicles (sometimes reduced to racemes), exceeding the upper leaves, exserted. Spikelets laterally compressed, with 4-11(16) florets, more than 1 floret bisexual; sterile florets distal to the bisexual spikelets; disarticulation above the glumes; glumes from shorter than to equaling the distal florets; lower glumes 1(3)-veined; upper glumes shorter than or about equal to the lower glumes, 1- to 3(9)-veined, unawned; calluses usually glabrous, sometimes pilose; lemmas hyaline or membranous, 3-veined, veins usually shortly hairy below, apex rounded to truncate, emarginate to bilobed, midvein often excurrent to 0.5 mm long, lateral veins not or more shortly excurrent; paleas glabrous or shortly pubescent on the lower back and margins, veins glabrous or ciliolate, margins widened or bowed-out below; lodicules 2, free or adnate to the palea; anthers 3, reddish-purple. Caryopsis dorsiventrally compressed and reniform in cross section, dark brown; embryos about $\frac{2}{5}$ as long as the caryopsis. x = 10.

Tridens, a genus of 16 species, is native to the Americas; 2 species are found in Chihuahua (Peterson et al., 2016).

KEY TO SPECIES OF TRIDENS

- 367. *Tridens albescens* (Vasey) Wooton & Standl., New Mexico Agric. Exp. Sta. Bull. 81: 129. 1912.

Plants caespitose, often with hard, knotty, short rhizomatous bases. Culms 30–100 cm tall; lower nodes sometimes sparsely bearded. Sheaths glabrous, not or obscurely keeled; ligules to 0.5 mm long, membranous, ciliate; blades 1–4 mm wide, folded or involute, glabrous, apex sharp. Panicles 8–25 cm long, 0.5–1.3 cm wide, dense; branches appressed, lowest branches 2–6 cm long; pedicels 1–2 mm long. Spikelets 4–10 mm long, with 4–11 florets; glumes about as long as the adjacent lemmas, thin, 1-veined, acute or apiculate; lower glumes 4–4.5 mm long; upper glumes 4–4.5 mm long; lemmas 3–4(5) mm long, thin, papery,

mostly white, often purple distally, glabrous or the lateral veins with a few short hairs toward the base, all veins ending before the distal margin; paleas 3-3.5 mm long, glabrous, bowed-out at the base; anthers 1-1.5 mm long. Caryopsis 1.5-1.8 mm long. 2n = 60, 64, 72.

DISTRIBUTION AND HABITAT. Tridens albescens grows in plains and open woods, often in clay soils that periodically receive an abundance of water. Its range extends into northern Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Cuauhtémoc: 16 mi NW of Zavalza, 3 Oct 1966, Reeder & C. Reeder 4573 (ARIZ).

368. Tridens texanus (S. Watson) Nash, Fl. S.E. U.S. 142, 1903.

Plants caespitose, with knotty, short rhizomatous bases. Culms 20-75 cm tall, slender, strictly erect; nodes glabrous; internodes often pilose. Sheaths mostly glabrous or pilose throughout, collar and distal portion of the margins densely pilose; ligules to 0.5 mm long, membranous, ciliate; blades 1-3(5) mm wide, flat or becoming inrolled, hispid, with long hairs on the adaxial surface just above the ligule, apex attenuate. Panicles 5–16 cm long, 2-9 cm wide, open or loosely contracted; branches (2)4-7 cm long, slender, lax, strongly divergent to drooping, basal portion naked, spikelets confined to the distal portion; pedicels (2)3-6 mm long. Spikelets 6–13 mm long, with 6–12 florets; glumes glabrous, 1-veined; lower glumes 3 mm long; upper glumes 3.5–4 mm long, veins bright green; lemmas 3-4.5 mm long, usually purple or rosy-purple at maturity, veins pilose to midlength, lateral veins often excurrent as short points; paleas 3-3.5 mm long, glabrous, abruptly broadened and bowed-out below; anthers 1-1.5 mm long. Caryopsis 1.5–2 mm long. 2n = 40.

DISTRIBUTION AND HABITAT. Tridens texanus grows in clayey and sandy loam soils, often in the protection of shrubs and along fenced road rights-of-way. Its range extends from southern Texas into northern Mexico. This species has been reported from Chihuahua (Espejo Serna et al., 2000).

Tridentopsis P. M. Peterson

Plants caespitose perennials; with knotty, short rhizomatous bases. Culms 20-80 cm tall, nodes often bearded, the hairs up to 2 mm long, soft. Leaf sheaths glabrous, scabrous, often pilose; ligules 0.4-1.5 mm long; blades up to 15 cm long, 1-5 mm wide, flat to involute. Panicles 7-28 cm long, 1-6 cm wide, narrow spreading; branches up to 13 cm long, erect appressed. Spikelets 7-13 mm long, 2- to 11-flowered, laterally compressed; disarticulation above the glumes; glumes 3-10 mm long, 1- to 7-veined, glabrous; lemmas 3.5-7 mm long, 3-veined, usually purple tinged, midveins sometimes excurrent, pubescent to pilose along the veins; paleas 1.5-5 mm long, shorter than the lemmas, glabrous or hairy. Caryopsis 1.5-2.6 mm long, dorsally flattened and deeply concave to folded on the dorsal or hilar surface and thickened toward the margin below, surface is reticulate, reddish-brown. 2n = 40.

The genus *Tridentopsis* has two species; both are distributed in the southwestern United States, northern Mexico, and the Caribbean (Peterson et al., 2014a, 2016). Plants occur on clay to sandy and rocky soils in arid environments from 0 to 2,000 m.

Tridentopsis differs from Tridens Roem. & Schult. in having paleas that are not widened or bowed-out below and caryopses that are dorsally flattened and deeply concave to folded on the dorsal or hilar surface, and thickened toward the margin below, the surface reticulate, reddish-brown (Peterson et al., 2014a).

369. *Tridentopsis mutica* (Torr.) P. M. Peterson var. *mutica*, Taxon 63(2): 284. 2014. *Tridens muticus* (Torr.) Nash, Fl.

S.E. U.S. 143. 1903. *Tricuspis mutica* Torr., Pacif. Railr. Rep. 4(5): 156. 1857.

FIGURE 238

Plants caespitose, with knotty, short rhizomatous bases. Culms 20–80 cm tall; nodes often with soft, 1–2 mm hairs. Sheaths rounded, lower sheaths often strigose or pilose, upper sheaths glabrous or scabrous; ligules 0.5–1 mm long, membranous, ciliate; blades 1–4 mm wide, usually involute or loosely infolded, glabrous, scabrous, or sparsely pilose, attenuate distally. Panicles 7–20(25) cm long, 0.3–0.8 cm wide; branches erect, spikelets imbricate but usually not crowded; pedicels 1–2 mm. Spikelets 8–13 mm long, with 5–11 florets; glumes glabrous, usually purple-tinged; lower glumes 3–8(10) mm long, 1- to 3-veined; upper glumes 4–10 mm long, 1- to 7-veined; lemmas 3.5–7 mm long, usually purple-tinged, midveins pilose on the basal ½3–½, rarely excurrent, lateral veins pilose to well above midlength, never excurrent; paleas 1–2 mm shorter than the lemmas, margins pubescent; anthers 1–1.5 mm long, Caryopsis 1.5–2.3 mm long, 2*n* = 40.

DISTRIBUTION AND HABITAT. *Tridentopsis mutica* var. *mutica* is a common species on dry, sandy or clay soils in the arid southwestern United States and adjacent Mexico. *Tridentopsis mutica* var. *elongata* (Buckley) P. M. Peterson & Romasch., known only from Texas, differs in having longer, widely spaced primary branches that are usually spreading up to 80° from the culm axis (Valdés-Reyna, 2003; Peterson et al., 2016).

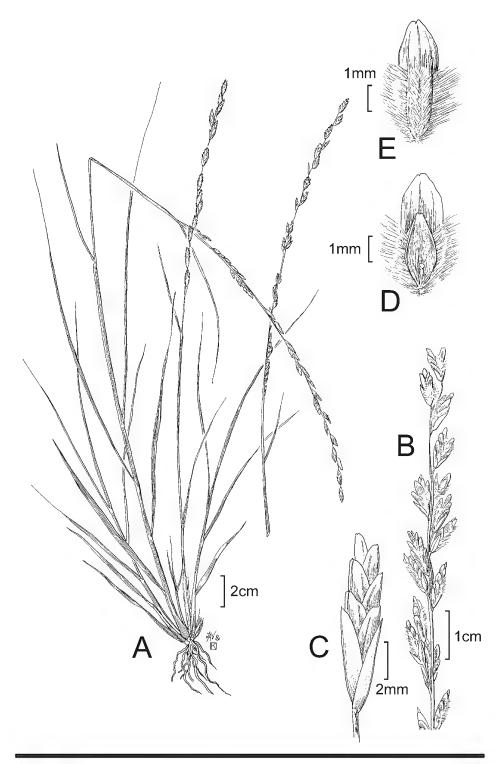

FIGURE 238. *Tridentopsis mutica* var. *mutica*. A. Habit. B. Inflorescence. C. Spikelet. D. Floret showing palea. E. Floret showing lemma. Drawn by Linda Ann Vorobik and Karen Klitz; copyright Utah State University.

Triniochloa Hitchc.

Perennial; caespitose or rhizomatous. Leaves narrow; sheaths with the edges united. Inflorescences in form of a terminal panicle. Spikelets with 1 floret, disarticulating over the glumes; glumes subequal, 1-veined, purple, usually short; florets slender, subcylindrical; lemmas 7- to 9-veined, faintly veined, the margins somehow inrolled over the paleas, firmer than glumes; callus oblique, barbed with straight hairs; lemma apex acuminate, membranous, 2-toothed, the awn inserted above the half of the back; paleas almost as long as lemmas, 2-veined, veins very close to each other, scabrous; rachilla not extended farther than the palea.

Triniochloa is an American genus with six species; five are found in Mexico.

370. *Triniochloa laxa* Hitchc., Contr. U.S. Natl. Herb. 17(3): 304, 1913.

Plants perennial; rhizomatous, rhizomes 0.8–1 mm thick. Culms 40–80 cm tall. Sheaths pubescent; ligules 1.5–2.5 (3) mm long; blades 15–25 cm long, 3–5 mm wide, persistent. Panicles 7–13 cm long, partially exserted, erect, narrow, with 6–18 spikelets. Spikelets 10–15 mm long; glumes subequal, 1-veined, purple, lower glumes 7.5–13 mm long, upper glumes 10–15 mm; lemmas 10–14.5 mm long, 7-veined, margins somehow inrolled over the palea, firmer than glumes, awns 12–22 mm long, dorsal, geniculate; paleas almost as long as lemmas, 2-veined, veins very close to each other, scabrous; rachilla not extended farther than the palea; anthers 5–7 mm long.

DISTRIBUTION AND HABITAT. Triniochloa laxa is known only from Chihuahua, Mexico. Triniochloa laxa differs

from other Mexican species of *Triniochloa* in having upper glumes about as long as the lemma, leaf blades 3–4 mm wide, and ligules 1.5–2.5 (3) mm long (Hitchcock 1913, 1935).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guerrero: On road between Tomochic and Bassaseachic, 20 mi E of jct w/ road S to San Juanito, 1.8 mi W of Aqua Caliente, 5 Oct 1986, 2000 m, Spellenberg, Soreng, R. Corral & T. Lebgue 8876 (NMC).

Tripsacum L.

Perennial; monoecious, staminate and pistillate spikelets evidently distinct, located in the same inflorescences, pistillate spikelets below the staminate spikelets. Culms 0.7-5 m. Leaves not aromatic; sheaths open; ligules membranous, erose to ciliate. Inflorescences terminal and axillary, panicles of 1 to several subdigitate to racemose rames; rames with pistillate spikelets proximally and staminate spikelets distally; disarticulation in the rames, beneath the pistillate spikelets and at the base of the staminate portions. Pistillate spikelets exposed, solitary, embedded in the indurate rame axes; lower glumes coriaceous, closing the hollows in the rachises and concealing the florets; upper glumes similar but smaller; lower florets sterile; upper florets pistillate; lemmas and paleas hyaline, unawned; styles 2, not fused; staminate spikelets paired, both sessile or both subsessile, or 1 sessile and the other pedicellate; glumes coriaceous, chartaceous, or membranous; lemmas and paleas hyaline, unawned; pedicels (when present) not fused to the rame axes. x = 9.

Tripsacum is a genus of 12 species. All are native to tropical and subtropical regions of the Western Hemisphere, and three are native to North America.

KEY TO SPECIES OF TRIPSACUM

- 1. Staminate spikelets on every pair sessile or almost sessile, or the superior with a thick pedicel 1–2 mm long, staminate portion of the inflorescence erect or lightly curved; inflorescence with 2 to 3 racemes, sometimes solitary.

371. *Tripsacum dactyloides* (L.) L., Syst. Nat. (ed. 10) 2: 1261. 1759. Coix dactyloides L., Sp. Pl. 2: 972. 1753.

FIGURE 239

Plants with short, knotty rhizomes. Culms 1–2(4) m tall, 3–5 mm thick below, clumped. Sheaths usually glabrous, occasionally slightly pilose; ligules ciliate; blades 30–75(120) cm long, 9–35(45) mm wide, flat, usually glabrous, tapering to attenuate apex. Terminal inflorescences erect, with (1)2–3(6) rames; rames 12–25 cm long. Pistillate spikelets 6–8 mm long, 3–5.5 mm wide; staminate spikelets all sessile or subsessile; glumes 5–12 mm long, coriaceous, blunt, acute, or bifid; pedicels, when present,

about 1 mm long, 0.5–0.8 mm wide, triangular in cross section, rigid. 2n = 36, 54, 72.

DISTRIBUTION AND HABITAT. Tripsacum dactyloides grows in water courses and limestone outcrops from central and eastern United States through Mexico to northern South America. Plants from the United States and northern Mexico belong to *Tripsacum dactyloides* var. dactyloides. This variety differs from the other two varieties in having erect stems and sessile staminate spikelets (Barkworth, 2003b).

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 7.4 km W of Balleza on road to Guachochi, 18 Sep 1991, huizachal, 1660 m, *P.M. Peterson, Annable & Valdés-Reyna*

372. Tripsacum lanceolatum Rupr. ex E. Fourn., Mexic. Pl. 2: 68. 1886.

FIGURE 240

Plants rhizomatous. Culms 1–2 m tall, 2–4 mm thick below. Lower sheaths hispid; upper sheaths essentially glabrous; ligules erose, not ciliate; blades to 100 cm long, 8–30 mm wide, glabrous or slightly pubescent. Terminal inflorescences with 4–7(10) rames. Pistillate spikelets 2–3 mm wide, beadlike in appearance; staminate spikelets in sessile-pedicellate pairs; glumes 5–10 mm long, 1.5–2 mm wide, usually membranous, acute; pedicels 2–5 mm long, less than 0.3 mm wide, almost flat to plano-convex in cross section, flexible. 2n = 72.

DISTRIBUTION AND HABITAT. *Tripsacum lanceolatum* grows in moist soil (often in canyon bottoms) of mountains from southeastern Arizona and southwestern New Mexico through Mexico to Guatemala.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: cerca [near] de Estación Divisadero, 16 Aug 1976, bosque de pino-encino [pine-oak forest], 1875 m, S. González 693 (RELC). 373. *Tripsacum zopilotense* Hern.-Xol. & Randolph, Folleto Técn. de Estud. Espec. México 4: 22. 1950.

Plants caespitose, in large groups. Culms 0.6-1.2(1.5) m tall, 3–4 mm thick on the base, pilose or glabrous below the spikes. Inferior sheaths strongly hispid, the superior hirsute to glabrous; blades 25-35 cm long, 0.5-1(1.6) cm wide, pilose on both surfaces, forming basal tufts at flowering time. Inflorescences 10-16 cm long, a solitary raceme, rarely 2 then digitate, the pistilate portion 4–7 cm long, 2–2.5 mm thick when mature, rounded, with 5-11 pistilate spikelets, 5-7 mm long. Staminate spikelets 5-7 mm long, sessile; inferior glumes coriaceous. 2n = 36.

FIGURE 240. *Tripsacum lanceolatum*. A. Inflorescence and leaf blades. B. Inflorescence branch with staminate spikelets. Drawn by Linda Ann Vorobik and Hana Pazdírková; copyright Utah State University.

DISTRIBUTION AND HABITAT. Tripsacum zopilotense grows in grasslands, oak woodlands, and pine forests; it is known from Mexico and Central America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Guachochi: slopes above Barranca de Basihuare, 28 Aug 2003, with *Quercus-Pinus ponderosa*, 1815 m, *P.M. Peterson & P. Trisetum Pers.

Annual or perennial; sometimes rhizomatous, sometimes caespitose. Culms glabrous or pubescent, basal branching extravaginal. Sheaths open the entire length or fused at the base; auricles absent; ligules membranous, often erose to lacerate, sometimes ciliolate; blades rolled in the bud. Inflorescence a terminal panicle, open and diffuse to dense and spikelike; branches antrorse-scabrous. Spikelets usually subsessile to pedicellate, rarely sessile, laterally compressed, with 2-5 florets; reduced florets (if present) distal; rachillas hairy, internodes evident, prolonged beyond the distal bisexual florets; disarticulation usually above the glumes and between the florets, subsequently below the glumes, in some species initially below the glumes; glumes subequal or unequal, keels scabrous, apex usually acute and unawned, often apiculate; lower glumes 1(3)-veined; upper glumes 3(5)-veined, lateral veins less than ½ the glume length; calluses hairy; lemmas 3- to 7-veined, margins hyaline, unawned or awned from above the middle with a single awn, apex usually bifid, sometimes entire; paleas subequal, equal to, or longer than the lemmas, membranous, 2-veined, veins usually extended as bristlelike tips; lodicules 2, shallowly and usually slenderly lobed to fimbriate; anthers 3; ovaries glabrous or pubescent; styles 2. Caryopsis elongate-fusiform, compressed, brown; embryos elliptic, to $\frac{1}{3}$ the length of the caryopsis; endosperm milky. x = 7.

Trisetum is a genus of approx. 96 species occurring primarily in temperate, subarctic, and alpine regions and is currently being re-evaluated (Soreng et al., 2017b). There are approximately 38 species in North America (Finot et al., 2004).

KEY TO SPECIES OF TRISETUM

- 1. Lemma 2-toothed on the apex, intermediate veins and/or marginal ones elongated beyond the apex forming 2–4 apical bristles; apical teeth veinless; lemmas awned, the awns well-developed, inserted on the distal 1/3, 1/2, or proximal 1/3 of the lemma, never subapical.

- 2. Awns inserted on the proximal ½ or nearly ½ of the lemma; glumes subequal, almost as long as the spikelets or longer; lemmas with apical teeth lacking prolongations of the intermediate veins or having 2–4 bristles; lemma rounded in cross section.
 - 3. Lemmas with the apex 2-lobed and 4-awned as teeth or bristles.

 - 4. Ligules 0.5–1(2) mm long; paleas shorter than the lemmas; hairs of the rachilla 1.5–3 mm long *T. viride*
 - 3. Lemmas with the apex 2-lobed, unawned or having additional bristles.

 - 5. Spikelets bearing 2–4 florets.

 - 6. Ligules 0.5–1(2) mm long; paleas shorter than the lemmas; hairs of the rachilla 1.5–3 mm long T. viride

374. *Trisetum filifolium* Scribn. ex Beal, Grass. N. Amer. 2: 375. 1896.

Perennial; caespitose. Culms 30-60 cm tall, glabrous. Sheaths glabrous, escabrous or pubescent; ligule (0.2)1-3.5 mm long, membranous, truncate, glabrous; blades 5-22 cm long, 0.5-2 mm wide, involute, filiform, curves and flexuous, glabrous to slightly scabrous. Panicles 12-15 cm long, 2-3 cm wide, lax, little spread, narrow, exserted, branches semiverticillate, with 3-7(8) branches per node, the inferior 4-6 cm long, rachis glabrous. Spikelets 3.5-6 mm long, with (1)2-3 florets, pedicels scabrous, rachilla 1-1.2 mm long, with hairs 1.5 mm long, longer than the apex; glumes subequal, lower glumes 2.5-6 mm long, 1(3)-veined, upper glumes 3–7 mm long, 3-veined; lemmas 3.5-5 mm long, obscurely veined, scabrous-pubescent, apex entire to shallowly bifid, every lobule muticous to mucronate, the mucro 0.2-0.5 mm long; paleas 3-4.5 mm long, keels ciliate or scabrous; anthers 1–2 mm long. Carvopsis 1.5–2 mm long with solid endosperm.

DISTRIBUTION AND HABITAT. Trisetum filifolium is a Mexican species with two varieties, only *Trisetum filifolium* var. *aristatum* Scribn. ex Beal grows in the moist, forested areas of Chihuahua and Durango.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Peterson, F.Sánchez Alvarado & E.P. Gómez Ruíz 20050 (CIIDIR, US). Ocampo: Parque Nacional "Cascada de Basaseachic," along river falls, 25 Abr [Apr] 1986, 1980 m, Spellenberg, Soreng, R. Corral & T. Lebgue 8434 (NMC); Memelichi, Rio Mayo, 14 Sep 1936, Gentry 2716 (MBO).

375. *Trisetum palmeri* Hitchc., Contr. U.S. Natl. Herb. 17: 325. 1913.

Caespitose perennial. Culms 60–100 cm tall, glabrous. Sheaths glabrous to scabrous; ligules 3–6 mm long, truncate, toothed, ciliate on the apex; blades 10–20 cm long, 1–3(5) mm wide, involute or flat, stiff, scabrous, sometimes glaucous. Panicles 10–20 cm long, 2–6 cm wide, lax, spread to narrow, branches 4–6, verticillate, rachis and pedicels glabrous. Spikelets 5–6.5 mm long, bearing 2–3 florets, rachilla 2 mm long, pubescent, the hairs 1–1.5 mm long; glumes subequal, linear-lanceolate, margin hyaline, apex acute; lower glumes 3.5–4.5 mm long, 1-veined; upper glumes 4–5 mm long, 3-veined; lemmas 4–5.3(6) mm long, fragile, translucent, 5-veined, awned, the awns 5–7 mm long, emerging from the proximal ½ of the lemma back, geniculate, twisted; paleas 4–5.5(6) mm long; anthers 2–2.5 mm long.

DISTRIBUTION AND HABITAT. *Trisetum palmeri* grows in moist meadows and forests. This species is known from Chihuahua, Coahuila, Durango, Jalisco, Nuevo León, Sinaloa, and Sonora.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Madera: Laguna de Babicora, 4 km N del Ejido La Raiz, 10 Sep 1994, 2300 m, *G. Quintana & E. Estrada 3666* (NMC).

376. Trisetum spellenbergii Soreng, Finot & P. M. Peterson, Ann. Missouri Bot. Gard. 91: 1–30. 2004.

Perennial; with short rhizomes. Culms 40–60 cm tall, geniculate on the base, glabrous. Leaf sheaths open only at the apex, lower sheaths pilose, upper sheaths glabrous; ligules 4.5–6 mm long, glabrous; lacerate, eciliate; blades 20–30 cm long, 2–3.5 mm wide, the superior smaller, 10–20 cm long, flat, soft, glabrous to sparsely pilose. Panicles 9–14 cm long, 2–8 cm wide, lax, spread, exserted, branches 2–5 per node. Spikelets 7–9 mm long, bearing (4)5–6 florets, rachilla 1.5 mm long,

pubescent, hairs 1–1.5 mm long, prolongate beyond of the superior floret, with 1 reduced floret; glumes subequal, green, purple over the apex and margins, lower glumes 5.5–6.5 mm long, 0.3–0.5 mm wide, 1-veined, upper glumes 6.5–7.5 mm long, 0.6–0.8 mm wide; lemmas 4–6.5 mm long, 5-veined, glabrous, apex bilobed, lobes 2 mm long, awns 8–12 mm long, emerging midlength, twisted, geniculate; paleas 3.5–5 mm long, 2-veined, veins scabrous-ciliate; stamens 3, anthers 1.2–2.5 mm long.

DISTRIBUTION AND HABITAT. Trisetum spellenbergii grows in moist meadows in forests; it is a Mexican endemic found in Chihuahua and Sonora.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ocampo: Parque Nacional "Cascada de Basaseachic," at overlook ca. 1 km airline S of Cascada, 3 Oct 1986, 2100 m, Spellenberg, Soreng, R. Corral & T. 377. *Trisetum spicatum* (L.) K. Richt., Pl. Eur. 1: 59 .1890. *Aira spicata* L., Sp. Pl. 1: 64. 1753.

FIGURE 241

Perennial; with both fertile and sterile shoots; caespitose, not rhizomatous. Culms 10-120 cm tall, erect, usually glabrous, sometimes scaberulous or villous. Leaves mostly basal or evenly distributed; sheaths variously pubescent or glabrous; ligules 0.5-4 mm long, truncate or rounded; blades (3)10-20(40) cm long, 1-5 mm wide, flat, folded, or involute, erect and stiff or ascending and lax. Panicles (5)20-30(50) cm long, (0.5)1-2.5(5) cm wide, from spikelike to open, often interrupted basally, green, purplish, or tawny, usually silvery-shiny; branches with the spikelets evenly distributed. Spikelets 5-7.5 mm long, sessile, subsessile, or on pedicels to 1.5(3.5) mm long, with 2(3) florets; rachilla internodes 0.5-1.5 mm long; rachilla hairs up to 1 mm long; glumes subequal to unequal, lanceolate, usually smooth, sometimes scattered scabrous or pilose, with wide scarious margins, apex acute to acuminate, sometimes apiculate; lower glumes 3-4(5.5) mm long; upper glumes 4-7 mm long, equaling or exceeding the lowest florets, less than twice as wide as the lower glumes; callus hairs to 1 mm long; lemmas 3-6(7) mm long, narrowly to broadly lanceolate, glabrous, scaberulous, or pilose, apex bifid, teeth usually less than 1 mm long, awned, awns 3-8 mm long, arising from the upper 1/3 of the lemmas, geniculate, twisted basally; anthers 0.7-1.4 mm long. Caryopsis 1.5–3(4) mm long, glabrous. 2n = 14, 28, 42.

DISTRIBUTION AND HABITAT. Trisetum spicatum grows in moist meadows, forests, rock ledges, and tundra slopes and screes up to 4,300 m. Its range includes both North and South America and Eurasia.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Balleza: 19.6 km W of Balleza and 74.2 km E of Guachochi,

378. Trisetum viride (Kunth) Kunth, Révis. Gramin. 1: 101. 1829. Avena viridis Kunth, Nov. Gen. Sp. (quarto ed.) 1: 147. 1815.

Caespitose perennial. Culms 50-150 cm tall, erect, glabrous, simple, the lower ½ with few leaves. Sheaths retrorsely scaberulous to glabrous when mature; ligules 0.5-6 mm long, membranous, truncate, to sometimes pilose; blades 15-20 cm long, 2-6(9) mm wide, flat or some involute. Panicles 15-35 cm long, 4-6 mm wide, lax, to somewhat contracted, main axis scabrous, branches 5-16 cm long, ascending to some flexuous, naked on the lower 1/2. Spikelets 5-8(9.5) mm long, with 2- to 3(5)-flowered, disarticulating above glumes and between the florets; rachilla pilose, the hairs 0.5-1 mm long, sometimes finishing in a rudimentary floret; glumes subequal; lower glumes 3.5-6 mm long, 1-veined; upper glumes 4-7 mm long, 3-veined; lemma of the inferior florets 4-6 mm long, subcylindrical, margins involute, apex 2-toothed, the teeth acute or rounded, erose or with extended veins forming 4 slender teeth, awned, awns 5-10 mm long, inserted on the lower ½, geniculate, flexuous, twisted; paleas equal or not as long as the lemmas, hyaline, the keels scabrous; stamens 3, anthers 1.5-2.5 mm long. Caryopses 2–2.5 mm long, soft, endosperm liquid. 2n = 28.

DISTRIBUTION AND HABITAT. *Trisetum viride* is found in pinyon forests in Chihuahua; it is known from Mexico to Central America.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Bocoyna: Cabecera de la cañada de Recogoata, 22 Sep 1997, bosque de pino-encino [pine-oak forest], 2400 m, A. Carrillo 30-A (MEXU). Triticum L.

Annual. Culms solitary or branched at the base; internodes usually hollow throughout in hexaploids, usually solid

for about 1 cm below the spike in diploids and tetraploids, even if hollow below. Sheaths open; auricles present, often deciduous at maturity; ligules membranous; blades flat, glabrous or pubescent. Inflorescences usually terminal spikes, distichous, with 1 spikelet per node, occasionally branched; disarticulation in the rachis, the spikelets usually falling with the internode below to form a wedge-shaped diaspore, sometimes falling with the adjacent internode to form a barrel-shaped diaspore, domesticated taxa usually nondisarticulating, or disarticulating only under pressure. Spikelets usually 1-3 times the length of the internodes, appressed to ascending, with 2-9 florets, the distal florets often sterile; glumes subequal, ovate, rectangular, or lanceolate, chartaceous to coriaceous, usually stiff, tightly to loosely appressed to the lower florets, with 1 prominent keel, at least distally, keels often winged and ending in a tooth or awn, a second keel or prominent lateral vein present in some taxa; lemmas keeled, chartaceous to coriaceous, 2 lowest lemmas usually awned, scabrous, distal lemmas unawned or awned; paleas hyaline-membranous, splitting at maturity in diploid taxa; anthers 3. Caryopsis tightly (hulled wheats) or loosely (naked wheats) enclosed by the glumes and lemmas, lemmas and paleas not adherent; endosperm flinty or mealy. x = 7.

Triticum is a genus of approximately 25 wild and domesticated species. It was first cultivated in western Asia at least 9,000 years ago and is now the world's most important crop, being planted more widely than any other genus.

379. Triticum aestivum* L., Sp. Pl. 1: 85. 1753.

FIGURE 242

Culms 14–150 cm tall; nodes glabrous or pubescent; internodes usually hollow, even immediately below the spikes. Leaf blades 6–15(20) mm wide, glabrous or pubescent. Spikes (3.5)6–18 cm long, usually thicker than wide to about as thick as wide, wider than thick in compact forms; rachises shortly ciliate at the nodes and margins, not disarticulating. Spikelets 10–15 mm long, appressed or ascending, with 3–9 florets, 2–5 seed-forming; glumes 6–12 mm long, ovate, coriaceous, loosely appressed to the lower florets, usually keeled in the upper ½, sometimes prominently keeled to the base, terminating in a tooth or awn, the awns to 4 cm long; lemmas 10–15 mm long, toothed or awned, the awns to 12 cm long; paleas not splitting at maturity. Caryposis with mealy to flinty endosperm. 2n = 42.

DISTRIBUTION AND HABITAT. *Triticum aestivum* is the most widely cultivated wheat. Both winter and spring types are grown in Mexico.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Chihuahua: 38 km W of hwy 45 on road towards Benito Juárez, 17 Oct 1992, pinyon woodlands, 2230 m, *P.M. Peterson & Annable 12572* (US). **Juárez**: Area of high sand dunes 5 km N of Samalayuca on the Juárez hwy, 28 Oct 1972, desiertos arenoso [sandy deserts], 1250 m, *T.L. Wendt, F. Chiang & M.C. Johnston 9934* (MEXU).

Urochloa P. Beauv.

Annual or perennial; usually caespitose, sometimes matforming, sometimes stoloniferous. Culms herbaceous, erect, geniculate, or decumbent and rooting at the lower nodes. Sheaths open; auricles rarely present; ligules apparently of hairs, the basal membranous portion inconspicuous; blades ovatelanceolate to lanceolate, flat. Inflorescences terminal or terminal and axillary, usually panicles of spikelike primary branches in 2 or more ranks, rachises not concealed by the spikelets; primary branches usually alternate or subopposite, spikelike, and 1-sided, less frequently verticillate, axes flat or triquetrous, usually terminating in a well-developed, rudimentary spikelet; secondary branches present or absent, axes flat or triquetrous; disarticulation beneath the spikelets. Spikelets solitary, paired, or in triplets, subsessile or pedicellate, divergent or appressed, ovoid to ellipsoid, dorsally compressed, in 1–2(4) rows, with

2 florets, lower or upper glumes adjacent to the branch axes; glumes not saccate basally; lower glumes usually $\frac{1}{2}$ as long as the spikelets, occasionally equaling the upper florets, (0)1- to 11-veined; upper glumes 5- to 13-veined; lower florets sterile or staminate; lower lemmas similar to the upper glumes, 5- to 9-veined; lower paleas if present, usually hyaline, 2-veined; upper florets bisexual, sessile, ovoid to ellipsoid, usually planoconvex, usually glabrous, not disarticulating, mucronate or acuminate; upper lemmas indurate, transversely rugose and verrucose, 5-veined, margins involute, apex round to mucronate, or aristate; upper paleas rugose, shiny or lustrous; lodicules 2, cuneate, truncate; anthers 3. Caryopsis ovoid to elliptic, dorsally compressed; embryos $\frac{1}{2}$ as long as the caryopsis. x = 7, 8, 9, or 10.

Urochloa is a genus of about 136 tropical and subtropical species. There are four species that occur in Chihuahua (Morrone and Zuloaga 1993).

KEY TO SPECIES OF UROCHLOA

- 1. Inflorescence with racemes alternate and inserted distichously; spikelets solitary at mid-branch length; in 1–2 series; pedicels all of equal length.
- 1. Inflorescence with racemes alternate, subopposite, or verticillate, inserted on all sides of the main axis; spikelets paired at mid-branch length, sometimes solitary distally, in 2–4 series; pedicels unequal in length.
 - 3. Inflorescence branch axes densely hairy, the hairs papillose-based; spikelets 3.2–4 mm long U. arizonica
 - 3. Inflorescence branch axes sometimes densely hairy, with few or no papillose-based hairs; spikelets 2–3 mm long

...... U. fusca

380. *Urochloa arizonica* (Scribn. & Merr.) Morrone & Zuloaga, Darwiniana 32(1–4): 61. 1993. *Brachiaria arizonica* (Scribn. & Merr.) S. T. Blake

Annual. Culms 15-65 cm tall, erect or geniculate, branching from the lower nodes; nodes glabrous or hispid. Sheaths glabrous or with papillose-based hairs, margins ciliate distally; ligules 1-1.6 mm long; blades 5-15 cm long, 5-12 mm wide, glabrous. Panicles 6-20 cm long, 2-5 cm wide, ovoid, with 6-12 raceme-like branches in more than 2 ranks; primary branches 3-7 cm long, divergent, axes about 0.4 mm wide, triquetrous, densely pubescent with papillose-based hairs; secondary branches short, divergent; pedicels shorter than the spikelets, with papillose-based hairs. Spikelets 3.2-4 mm long, 1.2-1.6 mm wide, mostly paired, in 2 rows, appressed to the branches; glumes scarcely separate, rachilla internodes short, not pronounced; lower glumes 1.5-2 mm long, to ½ as long as the spikelets, glabrous, 5-veined, sometimes with evident cross venation near the apex; upper glumes 2.5–3.2 mm long, glabrous or short hirsute, 7-veined, with evident cross venation distally; lower florets staminate or sterile; lower lemmas 2.5-3.2 mm long, about as long as the spikelet, glabrous or short hirsute, 5-veined; lower paleas present; upper lemmas 2.8–3 mm long, 1.2–1.6 mm wide, acute, beaked or mucronate; anthers 0.8-1 mm long. Caryopsis 1.5-2 mm long; hila punctiform. 2n = 36.

DISTRIBUTION AND HABITAT. *Urochloa arizonica* is native to the southwestern United States and northern Mexico.

Brachiaria fasciculata (Sw.) Parodi, Urochloa fasciculata var. reticulata (Torr.)
R. D. Webster.

Caespitose annual. Culms 15-120 cm tall, geniculate; nodes glabrous or shortly pilose. Sheaths glabrous or hispid, margins ciliate; ligules 1-1.5 mm long; blades 3-33 cm long, 5-20 mm wide, glabrous or sparsely pilose on both surfaces, margins smooth or scabrous; collars pubescent. Panicles 5-15 cm long, 2-8 cm wide, simple, with 5-30 raceme-like primary branches inserted in more than 2 ranks; primary branches 2-10 cm long, appressed to divergent, axils glabrous, axes 0.3-0.5 mm wide, triquetrous, scabrous or sparsely pilose; secondary branches usually present on the lower primary branches; pedicels shorter than the spikelets, scabrous and pubescent. Spikelets 2-3.4 mm long, 1.2-1.8 mm wide, obovoid, yellowish to reddish-brown or bronze-colored at maturity, mostly paired, in 2-4 rows, appressed to the branches; glumes sparsely separate, rachilla internodes short, not pronounced; lower glumes 1-1.5 mm long, at least 1/3 as long as the spikelets, glabrous, (1)3- to 5-veined; upper glumes (2)2.2-3.1 mm long, glabrous, 7- to 9-veined, cross venation evident throughout; lower florets usually staminate, sometimes sterile; lower lemmas 2-3.1 mm long, usually glabrous, 7-veined, cross venation evident throughout; lower paleas present; upper lemmas 1.8-2.9 mm long, 1.1-1.7 mm wide, apex acute to rounded, mucronate; anthers 1-1.6 mm long. Caryopsis 1–1.7 mm long; hila punctiform. 2n = 18, 36.

DISTRIBUTION AND HABITAT. Urochloa fusca ranges from the southern United States to Peru, Paraguay, and Argentina; usually in moist, often disturbed areas at low elevations. It frequently occurs as a weed but is occasionally grown for forage and grain.

SPECIMENS EXAMINED. MEXICO. Chihuahua. Ahumada: 5 km al N de Flores Magón, 7 Oct 1995, 1220 m, R. Corral, P. Olivas & J.O. Torres RCD6501 (UACJ). Batopilas: SW Chihuahua, Aug 1885, E. 382. *Urochloa meziana* (Hitchc.) Morrone & Zuloaga, Darwiniana 32(1–4): 68. 1993. *Brachiaria meziana* Hitchc., Contr. U.S. Natl. Herb. 12(3): 140. 1908.

Perennial; with short rhizomes. Culms 10–40 cm tall, branched in the inferior nodes. Sheaths pilose; ligules 0.6–1 mm long, a hairy row; blades 5–15 cm long, 5–10 mm wide, flat, rounded at the base, pilose. Inflorescence 2–5(9) cm long, 1–4 cm wide, angled, sparse with 5–10 racemes, these alternately inserted and tightly distichous, the rachis triquetrous, the racemes 1–3 cm long. Spikelets 2.7–3.6 mm long, 1.5–1.7 mm wide, solitary, glabrous, ovate-acute, with pilose pedicels; lower glumes 1–1.5(1.8) mm long, subacute, 3-veined, upper glumes 3–3.4 mm long, 5(7)-veined, rachilla internode inconspicuous; inferior lemmas equal to the upper glumes, 5-veined, ribbed on the middle part of the dorse, inferior palea translucid, widely ellipsoid; superior florets bisexual, superior lemma hardened, papillose. Caryopsis 2.4–2.6 mm long, 1.1–1.3 mm wide, ovoid.

DISTRIBUTION AND HABITAT. Urochloa meziana grows in grasslands, xerophytic scrub, and pine forests. It is known from Aguascalientes, Chihuahua, Coahuila, Colima, Distrito Federal, Durango, Guanajuato, Hidalgo, Jalisco, México, Michoacán, Nuevo León, Oaxaca, Puebla, Querétaro, San Luis Potosí, Tamaulipas, Veracruz, and Zacatecas (Espejo Serna et al., 2000).

FIGURE 243

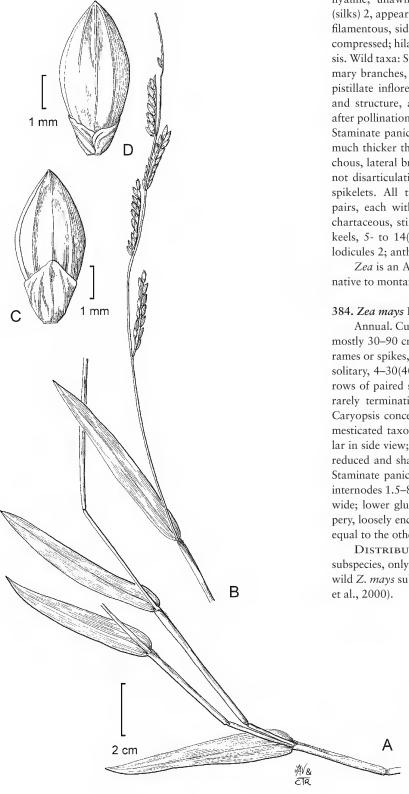

Annual. Culms 20–100 cm long, decumbent, geniculate, branching and rooting at the lower nodes; nodes glabrous. Sheaths mostly glabrous, except the margins ciliate, with papillose-based hairs; ligules 0.5–1.5 mm long; blades 3–21 cm long, 6–20 mm wide, glabrous, bases subcordate to cordate,

clasping the stems, margins sometimes ciliate basally. Panicles 6–25 cm long, 2–7 cm wide, with 3–8 racemes, these alternately inserted and distichous; primary branches 2–11 cm long, axes 1–1.5 mm wide, flat, margins scabrous; secondary branches absent; pedicels shorter than the spikelets, glabrous or scabrous. Spikelets (4)4.5–6 mm long, 1.9–2.2 mm wide, solitary, appressed to the branch axes, in 2 rows; glumes separated by an internode of about 0.5 mm; lower glumes 1.5–2.5 mm long, about ½ as long as the spikelets, broadly ovate, glabrous, 9- to 11-veined; upper glumes 3–4.2 mm long, glabrous, 7(9)-veined, without evident cross venation; lower florets sterile; lower lemmas 3–4.2 mm long, glabrous, 5-veined; lower paleas present; upper lemmas 2.7–3.6 mm long, 1.5–2 mm wide, apex rounded; anthers 0.7–1 mm long. Caryopsis 2–2.5 mm long. 2n = 36, 72.

DISTRIBUTION AND HABITAT. *Urochloa plantaginea*, native to western and central Africa, is found from the southern United States to Argentina. It is now established in the southeastern United States and northern Mexico, growing in loose sand and loamy soils. This species has been reported in Chihuahua (Espejo Serna et al., 2000).

Zea L.

Annual or perennial; monoecious, inflorescences unisexual or bisexual with the pistillate spikelets basal and the staminate spikelets distal. Culms solitary or several to many together, monopodial, often branching (branches frequently highly reduced and hidden within the subtending leaf sheath), usually succulent when young, becoming woody with age; lower nodes with prop roots; internodes pith-filled. Leaves not aromatic, cauline, distichous; sheaths open; auricles sometimes present; ligules membranous, shortly ciliate; blades flat. Pistillate or partially pistillate inflorescences terminal on axillary branches; staminate inflorescences (tassels) paniculate, of 1 to many branches or rames, sometimes with secondary and tertiary branching. Wild taxa: Pistillate inflorescences solitary, distichous rames (ears), these often tightly clustered in false panicles, each usually wholly or partially enclosed by a thin prophyll and an equally thin bladeless leaf sheath; rames composed of 5-15 spikelets in 2 ranks; disarticulation in the rame axes, dispersal units (fruit cases) consisting of an indurate, shiny rame segment and its embedded spikelet. Pistillate spikelets solitary, sessile, with 1 floret; pedicels and pedicellate spikelets suppressed; lower glumes exceeding the floret, indurate on the central, exposed portion, hyaline on the margins, concealing the caryopsis at maturity. Domesticated taxon: Pistillate inflorescences solitary, polystichous spikes (ears) terminating reduced branches, each spike surrounded by several to many, often bladeless leaf sheaths and a prophyll (husks), with 60-1000+ spikelets in 8-24 rows, neither spikes nor spikelets disarticulating at maturity. Pistillate spikelets in subsessile pairs, each spikelet with 1 functional floret; glumes shorter than the spikelets, indurate basally, hyaline distally; lower florets suppressed. All taxa: lemmas and paleas

hvaline, unawned; lodicules absent; ovaries glabrous; styles (silks) 2, appearing solitary by being fused except at the very tip, filamentous, sides stigmatic. Caryopsis subspherical to dorsally compressed; hila round; embryos about ²/₃ as long as the caryopsis. Wild taxa: Staminate panicles terminal on the culms and primary branches, sometimes also on the secondary branches and pistillate inflorescences; rames distichous, similar in thickness and structure, axes disarticulating below the sessile spikelets after pollination, abscission layers evident. Domesticated taxon: Staminate panicles terminal on the culms, central axes always much thicker than the lateral branches and irregularly polystichous, lateral branches distichous to more or less polystichous, not disarticulating, without abscission layers below the sessile spikelets. All taxa: Staminate spikelets in sessile-pedicellate pairs, each with 2 staminate florets; glumes membranous to chartaceous, stiff to flexible, sometimes with a pair of winged keels, 5- to 14(28)-veined, acute; lemmas and paleas hyaline; lodicules 2; anthers 3. x = 10.

Zea is an American genus of five species, four of which are native to montane Mexico and Central America.

384. Zea mays L., Sp. Pl. 2: 971-972. 1753.

Annual. Culms (0.5)1-3(6) m tall, (0.5)1-5 cm thick. Blades mostly 30-90 cm long, 2.5-12 cm wide. Pistillate inflorescences rames or spikes, usually shortly pedunculate (sometimes sessile), solitary, 4-30(40) cm long, (0.5)1-10 cm thick, with 2 or more rows of paired spikelets, hence the spikelets 4 or more ranked, rarely terminating in an unbranched staminate inflorescence. Caryopsis concealed in fruit cases (wild taxa) or exposed (domesticated taxon); fruit cases of wild taxa distichous, triangular in side view; domesticated taxon without fruit cases, glumes reduced and shallow or collapsed and embedded in the rachis. Staminate panicles 10-25+ cm long, with 1-60(235) branches, internodes 1.5-8.2 mm long; spikelets 9-14 mm long, 2.5-5 mm wide; lower glumes rounded dorsally, flexible, translucent, papery, loosely enclosing the upper glumes, the 2 lateral veins subequal to the others, not winged. 2n = 20.

DISTRIBUTION AND HABITAT. Zea mays has five subspecies, only the domesticated Z. mays subsp. mays, and the wild Z. mays subsp. mexicana grow in Chihuahua (Espejo Serna et al., 2000).

KEY TO SUBSPECIES OF ZEA MAYS

Zea mays L. subsp. mays

FIGURE 244

DISTRIBUTION AND HABITAT. Known from Canada, United States, Mexico, Central and South America, and the Caribbean.

Zea mays subsp. mexicana Iltis, Annual Rev. Genetics 5: 450. 1971.

FIGURE 245

DISTRIBUTION AND HABITAT. Known from Mexico in Chihuahua, Distrito Federal, Durango, Guanajuato, Guerrero, Jalisco, Michoacán, Nuevo León, Oaxaca, Puebla, and Querétaro.

Zuloagaea Bess

Perennial; caespitose, rhizomatous, rhizomes short, thin. Culms clumped or solitary, often with hard, cormlike bases, slightly compressed, erect or geniculate at the lower nodes. Sheaths shorter than the internodes, keeled, often pilose, hairs papillose-based near the throat; ligules membranous-based, ciliate; blades flat, adaxial surfaces scabrous. Panicles pyramidal, open, bearing 4-40 branches, basal node with 1 branch; primary branches with 3-6 orders of branching, straight or flexible, ascending to reflexed; pedicels scaberulous, divergent. Spikelets ellipsoid or lanceoloid, purplish or greenish, glabrous, acute or obtuse; lower glumes about 3/3 as long as the upper glumes, 3- to 5-veined; upper glumes slightly shorter to subequal to the lower lemmas, glabrous, 5- to 7-veined; lower florets sterile or staminate; lower lemmas glabrous, 5-veined, acute; lower paleas 3-4 mm long, hyaline; upper florets exceeding the upper glumes, margins embracing the lower lemmas, dull, pale, finely transversely rugose, apex acute, puberulent; anthers yellow-brown; stigmas pale purple, plumose. Caryopsis oblong, compressed, embryos about 1/3 the length of the caryopsis. x = 9.

Zuloagaea is a monotypic genus that is native to western North America.

385. *Zuloagaea bulbosa* (Kunth) E. Bess, Syst. Bot. 31: 656–670. 2006. *Panicum bulbosum* Kunth, Nov. Gen. Sp. (quarto ed.) 1: 99. 1815.

FIGURE 246

Culms 20–200 cm tall, 1–8 mm thick, erect or geniculate at the lower nodes; nodes glabrous or pilose; internodes glabrous. Sheaths shorter than the internodes, keeled, glabrous or pilose, hairs near the throat papillose-based; ligules with a 0.1–2 mm long membranous base and 0.10–3 mm long ciliate fringe; blades (6)20–75 cm long, 1.5–15 mm wide. Panicles 9–75 cm long, width to about $\frac{1}{2}$ length; branches straight or flexible, strongly ascending to reflexed; pedicels 0.2–5 mm long. Spikelets 2.5–5.5 mm long, 1–2 mm wide; lower glumes 1.2–3.5 mm long, $\frac{1}{2}$ as long as the spikelets, 3– to 5-veined; upper glumes 1.4–4 mm long; lower florets sterile or staminate; lower lemmas 2.9–3.3 mm long; upper florets 2.1–5 mm long, 1–1.5 mm wide, lemma apex puberulent. 2n = 36, 54, 70, 72.

DISTRIBUTION AND HABITAT. Zuloagaea bulbosa grows in roadside ditches and on gravelly river banks and moist mountain slopes, often in pine—oak forests. It is found from southern Nevada and Arizona to west Texas and central Mexico.

SUMMARY OF REQUIREMENTS FOR SMITHSONIAN CONTRIBUTIONS SERIES

For comprehensive guidelines and specifications, visit https://scholarlypress.si.edu.

ABSTRACTS must not exceed 300 words.

TEXT must be prepared in a recent version of Microsoft Word; use a Times font in 12 point for regular text; be double spaced; and have 1" margins.

REQUIRED ELEMENTS are title page, abstract, table of contents, main text, and references.

FIGURES must be numbered sequentially (1, 2, 3, etc.) in the order called out; have components lettered consistently (in size, font, and style) and described in captions; include a scale bar or scale description, if appropriate; include any legends in or on figures rather than in captions. Figures must be original and must be submitted as individual TIF or EPS files.

FIGURE FILES must meet all required specifications in the Digital Art Preparation Guide. Color images should be requested only if required.

TAXONOMIC KEYS in natural history manuscripts should use the aligned-couplet form for zoology. If cross referencing is required between key and text, do not include page references within the key, but number the keyed-out taxa, using the same numbers with their corresponding heads in the text.

SYNONYMY IN ZOOLOGY must use the short form (taxon, author, year:page), with full reference at the end of the manuscript under "References."

REFERENCES should be in alphabetical order, and in chronological order for same-author entries. Each reference should be cited at least once in main text. Complete bibliographic information must be included in all citations. Examples of the most common types of citations can be found at SISP's website under Resources/Guidelines & Forms.
